In most power supplies, the available current is determined by the physical characteristics (wire size and number of turns, core size) of the transformer used. To increase the available current, you'll need a larger transformer to start. To use the extra current, you will probably have to increase the rating on the regulator - this is where 2n3055-type transistors come into play. Additional heat sink material (fins, fans, etc) will also be necessary.

The best bet in your scenario is probably to build a new power supply and keep the 5A unit for something else - otherwise, you will wind up replacing everything inside, and probably won't have room in the box for the new components, anyway.

Good luck in '99...

You've lost me with the "power function" statement.

However, I'm pretty sure that average power is *not* proportional to the
RMS value in the general case.

Prms = SQRT((1/T) * Integral0->T(P^2 dt))

Pave = (1/T) * Integral0->T(P dt)

where Integral0->T means the integral from zero to time T.

Prms and Pave are proportional in a few cases, but not in many typical
cases.

Hi Glen, I had a very simular problem with an old 6JE6C tube amp that I use on 6M.The panel switch that switches from AM to SSB switched in an extra electrolytic capacitor to help hold the relay in,but the relay was still eratic. I found I had a bad ground connection between the extra electrolytic and chassis. Hope this helps,Happy New Year Bill K

So where can we find schematics and pcb layouts for this kind of thing.
I have done dozens of web searches and come up only with a million
different manufacturers. I found this newsgroup a while back and
subscribed and went through 1400 old messages collecting links and
hitting anything that even came near saying anything about circuits and
HOMEBREW, I have since started exploring these pages and have come up
with zilch. Most people advertise that they have a web page full of
circuits, schematics, and sometimes pcb layouts, but in reality they
have never actually posted them, or they are esoteric circuits, or
mainly just theoretical. Never been tested. Everybody keeps saying
"buy the book", I have ordered it and it won't be here for another
couple of weeks. And I know this is not the one single source of
information in this universe. And it can't be that complete.

So, that said, can anyone please tell me where I can find a schematic
and preferably a pcb layout of a high current power supply, and maybe
even a decent little 2M power amp??
I found good instructions on the net for a really good antenna, I know
there has to be some power supplies and maybe some amplifiers out there
too.

Hello All,
I have an R71a and MFJ-1020B Active Antenna. But I want to improve my 20 meter reception as there are some Ham in Florida I wanna hear. I can hear them now, but very week. I live in a townhouse and hiding something outside is a problem. I might beable to hide a 20meter dipole, but will the dipole do better than the Active Antenna???
Thanks,
George

Inadvertently left off the capacity...
I need 32mfd or better.
Other combinations considered also, such as a pair of 2500vdc75mfd oil filled caps would also work in series. Several 5000 or better caps to parallel up to the capacity would be OK.
I have a 4500vdc cap and I don't want to damage it with my variac set at higher than the rated capacity.

While I am at the keyboard....I could also use some 3A/1000v diodes to make up a high voltage diode stacks..bridge configuration ..so I need a bunch..

Hi to the group, I have seen some pretty sharp cookies on this
news group and was wondering if there are any programmers out
there who could give a budding programmer some advice.
I am interested as a hobbyist/experiment to learn and then write
a win/NT or Xwindows program to control a Yaesu FT847 via
computer and also via soundblaster input via a remote radio (ie
Handheld DTMF) anyone out there do any hacking and can point me
in the right direction?
Am I biting off more than I can chew?

As background I did do some fortran/cobol programming in
highschool so I have a small idea of what is going on, but I have
not done anything else.......
please reply to my email not the list.
Any input would be sincerely appreciated !

You probably can't build either of these cheaper than you can find
a used one.

For the power supply, the hardest thing to find will be the power
transformer. You then design the supply around the transformer
you can get. Small changes in output voltage can make a big difference
in how many transistors, capacitor size, and how much heat sink you
need.
Power supplies are NOT trivial to design. Even people who work for
power supply design companies don't often know what they're doing.
I've had to redesign more than one commercial supply to remove
OBVIOUS design flaws and make them reliable. There's a lot more to
it than meets the eye, or shows up on the component spec sheets.

Most people don't have the equipment needed to test their design.

A power supply is also a high risk item. You save a couple of bucks on a supply then hook it to a $2000 radio. If the supply shorts and over voltages. You just smoked your $2000 radio.

If you're insistent on building a supply, go read everything you can find on "Safe Operating Area" of transistors before you start.
Learn about current balancing in paralled transistors.
Use this info to analyze any design you find in a magazine before you build it. Reject any design (and author) that connects the regulator transistors directly in parallel.
There are a few subtleties in the PCB layout, but the big ones are in the wiring that hooks up all the high current stuff.

In case you haven't noticed, crummy power suppply designs is a major HOT BUTTON for me.
Good Luck,
miker

> increase, the Q apparently increases...

Not true, and there is a simple way to see this. And above all I
would suggest keep everything simple
and not get into a quagmire of electromagnetics and energy/power
arguments. Circuit analysis is all
that is needed for this problem. Q implies an energy relation and
it is only necessary to think in
terms of Q in the circuit analysis.

If the coil is a series Rs and Xs, and if the coil Q is, say 10 or
more, then the coil, considered
"all by itself" (ignore for the moment Cs) can be converted into a
parallel Rp and and a parallel Xp
whose values are very nearly given by the following:

Rp = wL * wL/Rs = wL * Q

Xp = wL

We now have virtually the same situation that I described
previously and the addition of stray
capacity Cs reduces the Q in the same way as before.

> : An AC circuit analysis of the parallel RLCs circuit leads to the following formula:
>
> : Q' = Q (1 - w^2 LCs)
>
> : For a fixed w and L, Q' decreases as Cs increases. Cs is assumed to be lossless.

> Yes, to get the true (coil) Q, I think we must know just how much
> energy is lost in the coil (and its parasitics).

To get the true coil Q we must find the stray capacity Cs. One way
to do this is to get the coil's
self resonant frequency using a grid dip meter. Then, knowing a
value of low-frequency (say at w/4)
inductance from the Q meter we can calculate a "good enough"
estimate of Cs. We then get true Q at

frequency w by solving my simple formula for Q, using Q' as
measured on the Boonton at the desired
operating frequency w.

Alas, all the world's information isn't yet on the Web. Sometimes it's necessary to look in a {shudder} library. The December 1998 issue of QST magazine has an article titled "A 13.8-V, 40-A Switching Power Supply". This issue is probably gone from the newsstands now, but should be available either directly or by loan from any library. It's a 2-part article, with the second part appearing in the January issue, which you can probably still get. The author is Manfred Mornhinweg, XQ2FOD. The December part is on pages 37-41, and the January part on pp. 41-44.

I think that it depends on what you prefer for the controller target
platform.
Are you a Linux (or any *NIX) user (you mention Xwindows), or do you
want to
stick to the Windows world?

My preferred way of playing around with a GUI for a project like this is
to
use a scripting language like Tcl, or Perl, with the Tk extensions. It
will
let you prototype things quickly, and it has the advantage of being
based
on a easy to learn interpreted language. To become 'productive' in
either
Tcl or Perl can take as little as a week or two, but, like any language,
I am
still learning things about them years later. You can always get
something
going using one of these methods, but if the program grows very large,
you may
find that performance becomes a problem, as you will have the overhead
of the

interpreter running on the host system (not all that big a problem with modern
fast machines).

If you want to stick with Windows, and want to put the effort into learning
some C++, I would recommend something like Borland (Inprise) C++Builder. It's
only about $99 for the standard version in just about any local chain computer
store. This is a pretty good way to quickly build GUIs for Windows, and I like
it somewhat better than the Microsoft offering (Visual C++).

Either way, you may want to pick up a book on 'C' and start going through some
of it. I think that you will find that background a big help when picking
up another language, even if you don't want to do the final project in C or
C++. However, please note that I am not a Fortran or Cobol programmer, so I
can't really judge how well that background will help in learning the other
languages. I was an old assembly programmer for mostly Intel processors, and
started picking up other languages before I even knew anything about C.
In retrospect, after learning to program in C, many things in other languages
have become much easier for me to pick up with the C background.

As for biting off more than you can chew, well, I do that all the time :-)
It's a very good way to learn, and drive yourself to pick up new things as
you go. Just try not to get too frustrated as you bump into those 'brick walls'
along the way. Ask someone when you get really stumped. There's plenty of
help out there, only a dial up connection away.

Do a quick 'net search on some (or all) of these languages and read some
of the information that you find. It may become an easier choice after you
see what is out there.

21. F.S. HV Plate transformer

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-01 00:00:00 UTC
From: The Calhoun Printers <calprint@gnat.net>
Message-ID: <368D84D2.3ABD9013@gnat.net>
Source record: 75284

Hypersil type plate transformer wt. 23 lbs. Primaries dual 110 volt (
connect in series for 220V operation)
primary fusing should be 20A slo-blow
Tapped HV secondary for 1850V or 2850Volt output in voltage doubling
bridge circuit at 1100mils max.
6.3 volt filiment winding at 15 AMPS CT. Also 12 volt winding. This
transformer was removed from
a Dentron Clipperton L HF AMP and was used to an amp that runs 4
t-160/572Btriodes at 1500 watts
out.

I want $50.oo for the transformer, shipped CONUS

73,
Vince N4BWD

22. WANTED: bakelite or phenolic stock

Newsgroup: rec.radio.amateur.homebrew

From: ns22ley@snowhill.com
Message-ID: <368DB6D6.4FD3@snowhill.com>
Source record: 75285

I am looking for a piece of bakelite or phenolic (or any other insulating material that can be sawn, filed, etc and withstand high temp) that measures at least 5/16" thick by 1/2" X 1" (anything bigger O.K. as long as the smallest dimension is at least 5/16"). NOTE: Please REPLACE the "ns22" with "wor" to spell "worley" in my email or call 334-347-5281.

I've gotten a Heath GD-1B from Ebay (for only $26.00 shipped!) and I
need a manual and operating instructions for it. I also need the specs
for the highest coil (the hairpin one). I plugged it in and it seems to
work, but I need some help.

25. Re: Dissipation factor of FR4 at 2.5GHZ ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-01 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <368D9D66.DAEBD31F@teleport.com>
Source record: 75288
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.cad,sci.electronics.design

Artech House's _Microwave Engineers' Handbook_, Vol. 2, shows "Epoxy, polyester, or silicone fiberglass laminate (120 lbs/cubic foot)" to have a dissipation factor of about 0.007 at "microwave frequencies", defined as 1 - 30 GHz (with a caution that values will vary with frequency). The value is sure to vary a lot with formulation as well as frequency.

Reference Data for Radio Engineers gives about 0.02 - 0.03 for epoxy resin at 3 GHz.

I recently designed a 6 GHz oscillator on the stuff with no problem, but the design would be quite tolerant of loss, and I made no effort to determine just how much there was.

> for modulation. . .

What you say is correct if "modulation envelope" is taken to mean the voltage or current waveform describing the envelope, but not if you mean the RMS value of envelope power. RMS and average power are different values for most waveforms, and as I pointed out in an earlier posting, the RMS power has no useful meaning, at least not for this application (or any other I know of).

27. Re: Silver Micas Vs NPOs

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-01 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <368DC873.4C0A6DFB@teleport.com>
Source record: 75290

In my experience, silver micas have a higher temperature coefficient
than good-quality NPOs, and the temperature coefficient varies from
one silver mica capacitor to another. I say "good-quality" because
I've heard from people who have found some bargain ones to have a poor
temperature coefficient. Any that you purchase from a reliable source
should be fine. I use only NPOs where good temperature stability is
important.

|> power *is proportional* to the r.m.s. value, which is what I did say.
|>
|> and a Happy New Year to you too!
|> Carl WB6YFZ
|
|You've lost me with the "power function" statement.
|
|However, I'm pretty sure that average power is *not* proportional to the
|RMS value in the general case.
|
|Prms = SQRT((1/T) * Integral0->T(P^2 dt))
|
|Pave = (1/T) * Integral0->T(P dt)
|
|where Integral0->T means the integral from zero to time T.
|
|Prms and Pave are proportional in a few cases, but not in many typical
|cases.

I wasn't talking in the general case. For any waveform, Pave = K*Prms for
that waveform. K will likely be different for different waveforms, but when
talking generally about power, what happens to one, happens to the other.
BTW, when referring to power, r.m.s. also describes a physical property, not
just a statistical one.

|G0MJW was writing about the British regulations, but in fact that
|definition is identical to the one used by the FCC (except that it says
|"power supplied to the antenna", which means that Gs can allow for
|transmission line losses).

I did see that he was in G-land, but I was sure that the regs would be
similar to keep the technical definitions consistent internationally. As it
was, he only omitted that it was over an 'RF' cycle.

>>>> rest of post snipped due to acute embarrassment <<<<

I know what I wanted to say, but it was so far off of what was actually
posted that it probably is a lost cause to try to correct it. I was so tired
that I was in bed within a half hour (7:30pm on New Year's Eve!) after I
finished and I'm afraid it showed up as pure drivel in the post. I
apologize for wasting your time with the rest of it.

73,
Carl WB6YFZ

From=3A Roy Lewallen <w7el=40teleport=2Ecom=3E
Subject=3A Question about high Q inductor

I think Tom's definition of Q is a good one=2C but it'll take me=2C at
least=2C a bit of head-scratching to decide how to translate this into
quantities I can easily measure=2E

Again=2C a fundamental problem is that while the Q of an ideal L-R
combination is well-defined and easy to measure=2C a real inductor has
this shunt capacitance involved=2E The Boonton procedure seems kind of
ridiculous to me=2C because determining the distributed capacitance of
the inductor would be quite a job in itself=2C requiring some sort of
measurement at at least two frequencies and some ugly algebra=2E Lookin=
g
again at the model of a series RL=2C with C across the combination=2C t=
he
C shouldn't affect the Q of the LR "inductor=22 combination=2E The Q of=

the LR combination itself (which is apparently what the Boonton
correction is referring to=29 will be different than the Q of the
three-component model (which may be what it's measuring=29=2E Terman's
definition would be for the three-component model=2C where an "effectiv=
e
inductance=22 (the equation for which was in my last posting=29 or
reactance is compared with the "effective resistance=22 to find the Q=2E=

Even if no energy is lost in the capacitor=2C its presence does increas=
e
the current in the inductor=2C which would reasonably lead to higher
loss=2E

So the first thing to determine is whether we're measuring the Q of
the LR portion only (as the "corrected=22 Boonton measurement seems to
be doing=29=2C or the Q of the whole LRC circuit (which seems to be wha=
t
Terman defines as inductor Q=29=2E Then=2C how to define it=2E Tom's ce=
rtainly
is fundamental=2C but how do we translate it to measurable quantities=2C=

and how do we use it in practice=3F Incidentally=2C it looks like my
method of measuring bandwidth and center frequency may be measuring
the Q of the LR combination only=2E But so far I haven't succeeded in
deriving it=2E

I've seen inductor Q used as a parameter in the design of sharp
bandpass filters=2E Here=2C what I'd do is use Terman's definition and =

an
=22equivalent=22 L and R=2E Even though the "equivalent=22 L is influen=
ced by
both the R and C=2C I'd expect the real component to behave pretty much=

like a series RL of the "equivalent=22 values over a narrow frequency
range (assuming the component is well below self-resonance=29=2E In thi=
s
case=2C Terman's definition leads to a value which is useful in a real
application=2E Would the more fundamental one based on energy be as
useful=2C especially if we didn't know in advance how much of the
apparent inductance is due to shunt C=3F

Roy Lewallen=2C W7EL

Dear 8877 (no ID - a pirate?)

1. Do you always spell it 'allways'?
2. Do you already know how to spell 'allready' correctly?
3. Are you a policeman?
4. Do you demand an answer?

These and other pointless questions in the New Year. Sigh.

|> for modulation. . .
|
|What you say is correct if "modulation envelope" is taken to mean the
|voltage or current waveform describing the envelope, but not if you
|mean the RMS value of envelope power. RMS and average power are
|different values for most waveforms, and as I pointed out in an
|earlier posting, the RMS power has no useful meaning, at least not for
|this application (or any other I know of).
|

Since r.m.s. is a power function, I can see why you get upset when someone
mentions "r.m.s. power". It's like saying "power power", which is
redundant. However, the books I have at hand indicate that the average
power *is proportional* to the r.m.s. value, which is what I did say.

and a Happy New Year to you too!
Carl WB6YFZ

G0MJW was writing about the British regulations, but in fact that
definition is identical to the one used by the FCC (except that it says
"power supplied to the antenna", which means that Gs can allow for
transmission line losses).

>Thus, while the average power out of the transmitter is a function of the
>r.m.s. value of the modulation envelope, the PEP value is effectively the

>for modulation.

The existing definition of PEP really doesn't need any further
interpretation - especially not one that leaves us wondering exactly
what the word "instant" means.

>You can get an "average" PEP by adding a number of
>"instances" and then dividing by that number.

Once again, it's better to leave well-enough alone. "Average PEP" has no
physically useful meaning - it's merely a contrived statistic.

This is often true, but there is a caveat. Some low-budget transmitters have a certain PEP rating for linear output, but the tubes and the power supply may overheat if the average power becomes too large. When using speech processing we have to check this out.

--
CUSHCRAFT ANTENNA COMPANY A HUGE DISAPPOINTMENT!

I have been Attempting to repair a ARX270N antenna from Cushcraft
for almost TWO YEARS.

I am serious!

After SEVEN attempts to get Cushcraft parts/service department to send me
"Capacitors" it is still stored in the my rafters waiting on
their Capacitors. I even cornered them at the Dayton Hamfest hoping to
shame them into the correct parts solution.

MY last attempt was to send Cushcraft the antenna and have them repair it
They sent it back with the base riveted back together and left the
top with the bad capacitors. I have no idea if they did any repairs
on the base capacitors.

Still my $300 antenna seems to be disposable item in CUSHCRAFT policy.
After two years of bumbling mistakes I am at the end of my rope.

I do not need the mistaken fastening Couplers they sent me!
I do not need the mistaken Base section they sent me!
I do not need any of the intended misunderstandings
I Just need the CAPACITORS THAT were DAMAGED Two weeks
after I purchased it new.

I have been very understanding and patient for TWO YEARS!

Now if you see a gentleman at the Dayton Hamfest with a 18' Cushcraft
antenna on his backpack Labeled:
"CUSH-CRAP SERVICE DEPARTMENT, I need my DAMN Capacitors to fix this".

I HOPE YOU WILL UNDERSTAND.

If I have to carry this antenna from Iowa to Dayton to get their attention
I am going to make sure my point is made!

THIS MAKES ME SO DAMN MAD, I just felt an obligation to express Cushcraft
not be the antenna manufacture of choice if you need parts or Service
support.

If you share my concerns Email me.

I have some experience of reducing the heat emitted form incandescent bulbs - I do not think that U will have much joy applying a heatsink compound directly to the bulb envelop and base - although if U find a suitable compound I would be interested to hear about it.

The solution I have used in the past is to build a metal frame around the bulb and cover the apperture where the light is to be emitted using a heat absorbing glass - Schott KG series glass are suitable.

If the optical transmission characteristics are critical then it may be possible to use a clear borosilicate glass with a interference filter, blocking in the NIR region.

Good Luck

Cheers

Andy

I would like to make a further input on this subject.

Consider an audio amplifier with a sine wave output whose voltage is:

v(t) = V cos(th) where th = angle theta and V is the peak value. Assume a resistance of 1 ohm (the actual value is not important).

The average power over a full cycle is

Pav = (V^2)/2

The instantaneous power within the cycle is

p(t) = (V^2)/2 * (1+cos(2 th))

Now find the rms power in 1 cycle by integrating the square of this equation:

(Prms)^2 = (1/2 pi) * int(0 to 2 pi) [(V^2)/2 * (1+cos(2 th))^2) d(th)]

(equations are confusing to read in this format)

This has the value

Prms = V^2 * sqrt(3/8)

The ratio of rms power to average power is

Prms/Pav = sqrt(3/8) *2 =1.22 which is 0.88 dB

Radiotron Designer's Handbook refers (somewhat vaguely) to rms power as a measure of "loudness", and audio systems often use the term "RMS Watts" in this context. The specs of peak linear power and RMS power define the amplifier pretty well, according to the audio folks.

FS: 22 volt 2.4 amp transformers in plastic case, with jack for computer type ac cord (120V 60Hz input). About 4" cubed, 3.5 lbs. each, unused mint condition, $3.75 each or 4/$14 plus UPS. 36330 zip.(Alabama) Can be used with a rectifier and appropriate sized cap to power 28 V filaments, or as is for 21 V or 24 V sweep tube filaments. Also good for 24 V power supply. NOTE: Please REPLACE the "ns22" with "wor" to make "worley" or call 334-347-5281 day/eve/wknd.

Subject=3A Help with SSB RF Sensing

During this festive holiday season=2C I have been working on an RF sens=
ing
circuit for use with my homebrew 6mx linear=2E For some reason=2C I can=
't seem to
get the sensing circuit to work well with a SSB signal=2E The FM=2C CW =
and AM are
okay=2C but SSB is hit and miss=2E I am coupling low level (7watts=29 R=
F thru a 7pf
cap and into a 2 diode clipping=2Frectifier circuit=2E This is fed to t=
he
non-inverting input of an LM-358 op-amp=2E Also from the non-inverting =
input=2C I
have a 10k resistor to grd=2E The output of the op-amp is tied back to=
the
inverting input via a 100k pot to control the gain=2E Also from the inv=
erting
input is a 10k resistor to grd=2E From the output=2C the DC is fed thru=
a 1k
resistor into the base of a 2N2222 that has the emitter grded and the
collector tied to the negative lead of a 12vdc relay=2E The other side =
of the
relay is tied to Vcc of 13=2E6vdc=2E I have bypassed the circuit with l=
ots of .01
and .1 mfd caps=2E

The circuit works great and switches just fine with all continuous carr=
ier

modes (FM=2C CW=2C etc=29 but when I try to set the gain for SSB input=2C=
the circuit
either does not switch on or else it causes the relay to "chatter=22 on=
and
off=2E A continuous whistle or "hhellllllooooo=22 switches it OK=2C but=
the setting
is too damn finicky to trust=2E If I set the gain a bit higher=2C the c=
ircuit
stays held even after the RF is removed from the input=2E

Any ideas on what I may be able to use to solve the problem=2E I do hav=
e the
'standby' system of using the PTT lead from the rig=2C but this seems s=
o simple
and reduces the wire count=2E=2E=2E=2E=2E=2E=2E=3F=3F

=3E=3EThank you=2C your doing both of us a favor=2E You get to keep yo=
ur amp
forever
=3E=3Eand I get to laugh at you every time you spam the newsgroups=2E
=3E
=3EYou should take off your blinkers=2E $600 is only =A3360=2E Now that=
is a little
=3Eexpensive=2C but not excessively so over here=2E Perhaps you forget =
the world
=3Eis not just the USA=2E
=3E

I didn't forget the world is just the USA=2E With that being said=2C I=
'm sure
his price isn't that unreasonable if you decide on the price of the
additional shipping to get it from the USA to the UK=2C or just a few s=
tates
over=2C and the high asking price to begin with=3F

I'm just factoring all the risk of buying a home built amp with a tube =
of
unknown quality and questionable building techniques (Since it would be=

bought sight unseen without any warranty or any other like it to base i=
t's
quality by=2E=29 I'm not saying it's poorly built=2C but=2C it's a big=
unknown=2E

=3EFor your information=2E A commercial 6m amplifier here using a 3-500=
z runs
=3Eto around =A3800 - thats $1300=2E
=3E

This doesn't sound unreasonable to me=2E Plus you have a baseline to j=
udge
quality and price by=2E You also have a baseline for what the price sh=
ould be
for any given condition=2E

Like anything else=2C you have to put things in perspective=2C it's rea=
lly worth
what someone is "willing=22 to pay for it=2E

It doesn't bother me that he doesn't want to negotiate a fair price for=
both
parties concerned=2C he already stated=2C "He wouldn't sell it to me at=
any
price=22=2C which is fine by me=2E What I find totally pointless is sp=
amming the
newsgroups with an add that he has demonstrated that he has no intentio=
ns of
selling the merchandise in the first place=2E

I guess his logic is spamm the hell out of us and someone will buy his =
amp
at an overinflated price to stop him from posting constantly=2E As I =
said=2C I
wish him the best of luck selling it=2E

> You probably can't build either of these cheaper than you can find
> a used one.

I doubt that I could find a used one. The only way I have seen used ones is for sale on the newsgroups and in the back of magazines and most want you to come pick it up, for obvious reasons. I have never seen one advertised close enough to my area for me to consider. We don't even have a ham radio retailer withing 150 of where I am at. None of the hams around here let go of their equipment once they get their hands on it, it is so hard to come by.

> A power supply is also a high risk item. You save a couple of bucks
> on a supply then hook it to a $2000 radio. If the supply shorts and
> over voltages. You just smoked your $2000 radio.

I won't have to worry about that. I will never own a $2000 radio. If I sold everything I owned right now I might be able to scrape up $2000. Maybe. I plan on buying the cheapest HT I can find and using it double duty. The power supply is for an amplifier I can use on my HT. That is why I want to get a good heavy duty power amp and supply and the cheapest HT I can find. Because I am not rich and cannot even dream of buying a $2000 radio. Or even 1/4 that. My whole outfit is gonna have to cost me less than $500. The antenna is homebrew. I always heard that hams were notoriously cheap, I have obviously been misinformed.

> If you're insistent on building a supply, go read everything you can
> find on "Safe Operating Area" of transistors before you start.

Well I am not that /insistent/ on building, I just didn't want to do it the typical amerikan way and buy my way out of the problem. Arrogance teaches you nothing. I wanted the satisfaction of making this thing with my own two hands. I just find it hard to believe that I can't build one for less than $200. The first power supply I built was exactly like the ones on the market for the application, it was a power supply we needed as electronics students. It would be our supply for all our projects. You could go down and buy one for $50 or you could make it for $10. I was very happy with myself when that power supply fulfilled my needs. I still have it today. I even mounted my breadboard to it.

> In case you haven't noticed, crummy power suppply designs is a major
> HOT BUTTON for me.
> Good Luck,
> miker

I don't want a crummy power supply, I want a decent one. Not medical grade. Just something that will suit my needs. I still find it hard to believe that it cannot be had. At a reasonable price.

Printed Circuit Board Tutorial

PCB Milling has a brief tutorial on Gerber and NC Drill files that may be of interest to beginners and first-time users of PCB layout software. This step-by-step overview describes file creation using a freeware CAD package, examination of the results with a freeware viewer program, and analysis of the output data. Links to both programs can be found on the company's web site.

You can view the tutorial at <http://www.pcbmilling.com/tutorial.htm>.

You have never been to our library. I have never in my entire life been in a library I didn't enjoy being in until I moved here. They have two book sections. One for the preschoolers and one for the first graders. They never heard of interlibrary loan until I told them about it. And they didn't believe me at first. The second time I asked about getting a book like this it took three months to get it. I have never been back. Besides I don't like wading thru the hollerin little kids to get to the desk. The library is practically on the campus of the elementary school. There are 2000 people in this town and 1500 of them are under the age of 9. I like kids and all, but an angry mob is an angry mob, no matter the age.

I stand partially corrected. Thanks. I should have shown P
as a function of time [P(t)].

I slipped up in the notation, but meant the same thing.

However, the SQRT() does belong. Without it, you don't have
a "root" mean square.

This is an interesting point that makes me wonder:

so many new rigs have "protection" circuits with which I'm not entirely
familiar. DO you (or someone else) know if they're protected against
both of these possible failure modes. My last rig didn't have a speech
processor (I just purchased a new one), and I haven't checked out the
cases in which the new one goes into current or power limiting.

In a nutshell, what factors really control the "protection" circuitry?

Very interesting. Are you saying that the "loudness" of an arbitrary-waveshape sound is proportional to the RMS power of the sound? I have no background in audio work, but was under the impression that perceived loudness was a logarithmic function of the power (but maybe a logarithmic function of the RMS rather than average power?).

The ratio of RMS to average power is of course different for each waveform, so the 0.88 dB difference you calculate wouldn't hold for, say, music or voice waveforms. If perceived loudness is indeed proportional to the RMS rather than average value, then this is indeed a legitimate use for RMS power, the first I've heard of. It would be interesting to learn how this was determined.

> In a nutshell, what factors really control the "protection" circuitry?

Limiting forward power with a directional coupler is one way. This can utilize average power or PEP. High forward power can stress broad band transistor PAs even though the actual power (forward minus reflected) is what it should be.

DC current control is another way. I believe some such as Ten-Tec do both of these. I use a regulated supply with current limiting that very quickly turns down the supply volts on excessive peak current demand.

In general, the average long-term heating of tubes, transistors and power supply components would be the thing to look out for, and the protection stuff may not do a good job in that respect if components are marginal. I think most mfrs keep this under control but some rigs, including some homebrew, may not.

A speech processor can easily raise the average power, for a constant PEP, for speech by a factor of four.

Yes, I am sure the Fletcher-Munson thing is quite correct, but maybe the audio guys, which I am not, use rms power rather than average power, as you suggest. One thing is for sure, the rms number is bigger and more impressive, and maybe that is the motivation. But I think maybe those folks have a rationale for the rms power idea and I'm not inclined to be cynical about that. The Radiotron Book has some material that you might like to look at.

It may be that rms power is a better measure of the stresses on circuits, power supplies and loudspeakers for complex waveforms that have large dynamic range. I think there is something to that.

> The ratio of RMS to average power is of course different for each
> waveform, so the 0.88 dB difference you calculate wouldn't hold for,
> say, music or voice waveforms.

I didn't claim that, of course, as you mention. The idea was to show one simple example of how average power and rms power are related mathematically. For complex signals, digital signal processing could perform the same calculation very easily, if for some (strange?) reason one wanted to do that.

My Bose catalog mentions an IEC Power Rating System. Maybe someone knows what that is.

I believe that "Average Power Control (RMS = heating effect)" and "Peak Power Control (~PEP) each have a legitimate place in power amplifier design. The APC protects against over-temperature, and the PPC constrains the signal within the linear operating range. Kudos to all for the helpful tone of the posts! 73 de W1AEL, Allan.

66. Various Types of capacitors

I'll admit some ignorance. Why are mylar capacitors used sometimes as bypass capacitors instead of ceramic?

When do I use aluminum eletrolytic as apposed to tantalum?

What do I use to replace old paper capacitors in old radios?

Could someone refer me to some good reference on capacitors? I really don't know how I got to this point without knowing the basic differences.

67. Re: PEP vs RMS Protection Circuits

Source record: 75243

I'm still a little concerned about the (RMS = heating effect)
following "Average power control". As Bill, I, and others have pointed
out, RMS is not the same as average (except for a few special
waveforms, like DC).

One more time. Average power, not RMS power, determines the heating
effect. One watt of average power of any waveform will cause the same
heating as one watt of DC power. One watt of RMS power is not the same
amount as one watt of average power, so it will cause more or less
heating than that, depending on the waveform.

The reason for the confusion, I think, is that If you multiply RMS
current times resistance, the result is the average (not RMS) power,
which has the equivalent heating property I mentioned. Similarly, the
RMS voltage divided by the resistance equals the average (not RMS)
power. So the useful quantities when calculating heating effect are
RMS voltage, RMS current, and average power. Not RMS power.

=3E=3EThank you=2C your doing both of us a favor=2E You get to keep yo=
ur amp
forever
=3E=3Eand I get to laugh at you every time you spam the newsgroups=2E
=3E
=3EYou should take off your blinkers=2E $600 is only =A3360=2E Now that=
is a little
=3Eexpensive=2C but not excessively so over here=2E Perhaps you forget =
the world
=3Eis not just the USA=2E

=3E

I didn't forget the world is just the USA=2E With that being said=2C I=
'm sure
his price isn't that unreasonable if you decide on the price of the
additional shipping to get it from the USA to the UK=2C or just a few s=
tates
over=2C and the high asking price to begin with=3F

I'm just factoring all the risk of buying a home built amp with a tube =
of
unknown quality and questionable building techniques (Since it would be=

bought sight unseen without any warranty or any other like it to base i=
t's
quality by=2E=29 I'm not saying it's poorly built=2C but=2C it's a big=
unknown=2E

=3EFor your information=2E A commercial 6m amplifier here using a 3-500=
z runs
=3Eto around =A3800 - thats $1300=2E
=3E

This doesn't sound unreasonable to me=2E Plus you have a baseline to j=
udge
quality and price by=2E You also have a baseline for what the price sh=
ould be
for any given condition=2E

Like anything else=2C you have to put things in perspective=2C it's rea=
lly worth
what someone is "willing=22 to pay for it=2E

It doesn't bother me that he doesn't want to negotiate a fair price for=
both
parties concerned=2C he already stated=2C "He wouldn't sell it to me at=
any
price=22=2C which is fine by me=2E What I find totally pointless is sp=
amming the
newsgroups with an add that he has demonstrated that he has no intentio=
ns of
selling the merchandise in the first place=2E

I guess his logic is spamm the hell out of us and someone will buy his =
amp
at an overinflated price to stop him from posting constantly=2E As I =
said=2C I
wish him the best of luck selling it=2E

From=3A ve6inm=40my-dejanews=2Ecom
Subject=3A Help with SSB RF Sensing

During this festive holiday season=2C I have been working on an RF sens=
ing
circuit for use with my homebrew 6mx linear=2E For some reason=2C I can=
't seem to

get the sensing circuit to work well with a SSB signal=2E The FM=2C CW =
and AM are
okay=2C but SSB is hit and miss=2E I am coupling low level (7watts=29 R=
F thru a 7pf
cap and into a 2 diode clipping=2Frectifier circuit=2E This is fed to t=
he
non-inverting input of an LM-358 op-amp=2E Also from the non-inverting =
input=2C I
have a 10k resistor to grd=2E The output of the op-amp is tied back to=
the
inverting input via a 100k pot to control the gain=2E Also from the inv=
erting
input is a 10k resistor to grd=2E From the output=2C the DC is fed thru=
a 1k
resistor into the base of a 2N2222 that has the emitter grded and the
collector tied to the negative lead of a 12vdc relay=2E The other side =
of the
relay is tied to Vcc of 13=2E6vdc=2E I have bypassed the circuit with l=
ots of .01
and .1 mfd caps=2E

The circuit works great and switches just fine with all continuous carr=
ier
modes (FM=2C CW=2C etc=29 but when I try to set the gain for SSB input=2C=
the circuit
either does not switch on or else it causes the relay to "chatter=22 on=
and
off=2E A continuous whistle or "hhellllllooooo=22 switches it OK=2C but=
the setting
is too damn finicky to trust=2E If I set the gain a bit higher=2C the c=
ircuit
stays held even after the RF is removed from the input=2E

Any ideas on what I may be able to use to solve the problem=2E I do hav=
e the
'standby' system of using the PTT lead from the rig=2C but this seems s=
o simple
and reduces the wire count=2E=2E=2E=2E=2E=2E=2E=3F=3F

I am building a dip meter, from the Handbook, it calls for silver Micas,
they are a bit hard to find, are NPO ceramics as stable as Silver Micas.

Thanks

77. INCREASING MY POWER SUPPLY OUTPUT

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-02 00:00:00 UTC
From: FREE EAST TIMOR <titania@ats.com.au>
Message-ID: <915255050.680247@dns2.ats.com.au>
Source record: 75298

Thank you to all those that replied.
I certainly got a variety of answers and as a result will probably buy a new power supply, however before I do let me just give some more information.
I have some 3 very large power supplies that come out of those very large computers. The Transformers are very big, the capacitors are large , the heatsinks also large and the particular one I would like to convert or perhaps the best words are "use the parts of" has about 12 X 3055 power transistors preceded by 4 X rectifier diodes. Basically I have the stuff that's needed and the patience, and armed with enough information to make me dangerous I want to try building this thing.
And in response to one person about testing it afterwards, our Australian Radio and Communications magazine which has just recently published an article on upgrading a desktop computer power supply to output 20 amp also gave an example of how to make a load to test the output, they used a length of fencing wire on a wooden frame that is tapped for 5, 10,15 and 20 amp points.
Yes it does sound like something you would hook up in the paddock but it worked for the Wright Brothers.
Laurens

Just to add a little to what Roy said, the conventional G-10/FR-4 material gets fairly lossy above 1 GHz or so. The Artech information is extremely optimistic and the value Roy quotes from the Reference Data for Engineers book is much more realistic.

Polyester fiberglass (Glasteel) is a lower loss material in this frequency range but the manufacturing process tends to produce a material with somewhat nonisotropic dielectric properties (cross grain is different than machine grain). Also thickness variations in this product are not as tightly controlled making microstrip design rather difficult to reproduce.

Specialized PCB material for microwave use is generally used above S-band. It is expensive, but it is reproducible. Manufacturers are Rogers, Trans-Tech, Arlon, Gore, etc.

Most of my experience in this area is at least two years old. With the push for 2.45 GHz digital PCS and such, I expect some of the circuit board manufacturers have spec'ed their materials for this band. I would also expect that some new board materials have been produced with better dielectric properties than FR-4 but not as expensive as the Duroids and such. Maybe Glasteel has seen the light! :-)

Since the two sets of national regulations are otherwise so very
different, I was astounded that the technical definitions are so nearly
the same!

OK, but of what use is this fact? We have a factor K that has no
utility whatever. It's different for every waveform, which means it
changes every millisecond I speak into the microphone.

> K will likely be different for different waveforms, but when

Could you explain that further? RMS is definitely a statistic. I don't know what it means to call it a physical property.

Source record: 75306

> > |Prms = SQRT((1/T) * Integral0->T(P^2 dt))

This is incorrect. The RMS value of "any" function F(t) is

Frms = 1/T int(0 to T) F(t)^2 dt

86. Internet sports talk help

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-02 00:00:00 UTC
From: btoal@aol.com
Message-ID: <19990102104504.00396.00007661@ng-ft1.aol.com>
Source record: 75307

I recently downloaded Destiny Lite and started doing sports talk shows utilizing the software. I have done local radio with this format and when I heard about destiny, it seemed like a great way to continue doing something I love, with a potential to reach a wide audience. Recently I got the brainstorm that with enough people who posses the software, I could start kind of an online sports station (obviously not a station as much as someone continuously doing a sports talk show on destiny with the same title so it would seem like one station). I would like to treat it like a station however, where hosts get certain time slots, and listeners can email questions to the host, staff meetings via chatrooms or email etc. Obviously this would all be non profit and volunteer.
My purpose for writing this email is basically two fold. First, can someone help me out in letting me know if this is a feasible concept (even f it were just an evening thing where we ran from 5-11 PM). And secondly if this was an idea that I could get off the ground would there be anyone interested in taking a time slot? Any help you might be willing to offer would be appreciated.
Thank you,
Brian Toal
The Perfect Stranger

>>To describe a PEP, a power level in watts, as having an rms value is
>>meaningless.

No it isn't. It's a quite simple and proper way of describing the peak voltage and power output capability of a power amplifier. The average power of the amplifier is of no consequence to the amplifier except in certain design areas. It is the peak output power (within the linear range, that is) capability that defines the amplifier's power rating. It is the type of voice you have, the type of audio and/or RF processing you use which determines the RMS Power. And the characteristics of the meters determine what you see as RMS power on your Wattmeter, etc.

Why this concept continues to be the source of discussion, debate, misunderstanding, and misconception is simply beyond me. In SSB, DSB, AM, CW, etc., the peak power capability of the transmitter is the important issue. The definition simply needs to be refined to the peak power capability (while still in the linear transfer area) when AM-relalted modulation signals are being amplified.

Looking for 2 or 3 adapters - with "C" male on one end, "N" female on the other.

This is a UG-565.

Will pay cash or have UG-567 - "C" right angle adapters, UG-643 - "C" double female adapter or other connectors to trade.

Please reply via email.

Thanks,

Bill

I use the Heil HM-10 (toggle switch between element #4 and #5). I
nearly always get good audio reports when used with the 756. I do
not use a mic pre-amp as I find the mic gain on the 756 is
sufficient. This was not true with the 726. A pre-amp is necessary.
All of these low end stock mics will do the job. To get studio
quality super audio you have to use mics that cost as much as the
rigs. I don't really see the point on side band unless you have bucs
to burn!

Sounds like your pretty steamed up. Simmer down and I will try to help you out. I think I read or re-read all the previous posts. There was only one that gave any info at all about what you have on hand. (the one where you briefly described a supply with 12 2n3055 power transistors in it.) I dont need any info about your mother's feet, but I will surely have to know a little more about the electronics you have on hand in order to help you. You very well may have everything you need to make the supply you require, but we dont know what you have.

Give a better description. For each supply, try operating it into a load that you think will be reasonable.. at least an amp or two. Find out what the output voltage is and whether its working. Use a vom and find out what the raw dc voltage is before the pass transistors. Measure the AC voltage at the input to the rectifiers. Power it down and make some visual inspections, or maybe do this first. Note some things like the dimensions of the transformer (gives us a rough estimate of power capability), values of the filter caps, describe the diodes...are they a 1n number? are they huge stud mount devices? Look at the chassis...is there any usefull info there? like the ratings of output voltage and current? Are all the supplies the same, or are there different kinds? The little info you gave before, like the 12 transistors tells me that it is capable of a good current, but more is needed.

With this kind of input, you will probably get usefull feed back, but we just dont know what the hell you have. It may turn out that you can use the components to make a new supply, like say wiring 2 or more of the transformers in series to get higher voltage and use the transistors and frame as the pass regulator. There are a lot of possibilities, but you cant get any help when you just say that you have a power supply and you want instructions for increasing the output. It doesnt work like that.

After thinking about this a little more, while shoveling the snow, it occurs to me that 0.88 dB is correct for any waveform. It goes like this:

A complex waveform can be broken down into a set of sine wave components at various frequencies. The total power is the sum of the powers at the distinct frequencies. This applies to the average power at each frequency, therefore it applies also to the rms power at each frequency.

I'm thinking more and more that the rms power thing for audio systems is a marketing gimmick. A 100 watt amplifier is made to look like a 122 watt amplifier.

>
> Bill W0IYH

I don't believe that 0.88 dB is correct for all waveforms. Remember, the 0.88 dB value isn't the value for a sinusoidal power waveform, but for a sine-squared waveform. For a symmetrical sinusoidal waveform, the RMS is the well-known 1/sqrt(2) times the peak value, while the average is zero. Adding the sinusoidal components of the voltage or current waveforms doesn't work, either, because the square of the sum isn't equal to the sum of the squares. As an example of another power waveform, consider a square wave of current, +1 volt for half its period and -1 volt for the other half, going through a 1 ohm resistor. As a function of time, the power is constant, with value of one watt. Both the average and RMS values of this waveform are one watt.

I have the same suspicion you do about audio amplifiers, but would like to hear from some audio folks on the topic. There's undoubtedly a newsgroup catering to this, so it would be an interesting question to post there.

Spoken like a true engineer. I wouldn't have considered using FR4 for microwave design when I was designing high-cost, low-volume test equipment. But as I mentioned, I recently did a 6 GHz oscillator on the stuff. This was for a client making a very low-cost, high-volume product. By making the design tolerant to loss, I was able to keep the cost (an extremely important factor here) down considerably by using FR4. As for a one-off homebrew project, I might use FR4 even for that, if that's all I had on hand and if the design would tolerate the loss.

Anyone can design a bridge that can stand up. It takes an engineer to design a bridge that will barely stand up.

Roy Lewallen, W7EL

Source record: 75180

I'm making a transformer to match a .43 ohm (43/100) source
to a 50 ohm load to operate at 1.85 Mhz.
The amateur handbook talks about broadband transformers
and says "The reactance of the windings should be at least
four times the impedance the winding is designed to look into."
This is not a broadband transformer so do I follow the same
formula or is there another for narrowband transformers.

Mike

For a tuned transformer you can get by with a lower shunt impedance, as long as the impedance is reactive and not resistive. This means using a material which has a reasonably high Q at the frequency of interest. (Type 2 and 6 powdered iron fit this description or, if you're not dealing with much power, some of the 60-series ferrites should be o.k.) The winding impedance can generally be absorbed into the tuned circuits. That is, it becomes part of the tuned circuits. The hardest thing to deal with will probably be stray series inductive reactance, which is likely to be as large or larger than the 0.43 ohm resistance you're trying to match. You may or may not be able to compensate for this by adjusting the tuned circuits. It might be easier to do the transformation in two stages, with two transformers.

You might consider using something like an L network, or possibly a tee or pi. With the right choice of topology, you can probably absorb strays into the network elements.

The 0.88 value for rms power of a sine wave is the average value of a"square of a sine-squared" function, as shown in a previous post.
The average power is for the average of a "sine-squared" function. See text below for clarification.

> For a symmetrical sinusoidal waveform,
> the RMS is the well-known 1/sqrt(2) times the peak value, while the
> average is zero. Adding the sinusoidal components of the voltage or

> period and -1 volt for the other half, going through a 1 ohm resistor.
> As a function of time, the power is constant, with value of one watt.
> Both the average and RMS values of this waveform are one watt.

The "average power" is equal to the "peak power" of the square wave and the rms "voltage" is equal to the "peak voltage" of the square wave. Average power is *always* rms voltage squared (if R=1 ohm).

If you decompose the square wave (or any other wave) into its frequency components, and calculate the average power in each component, and then add all of these up, you get the

wave average power. If you do the same thing with the rms power components you get the rms power (not the average power) of the wave, which is 0.88 dB higher.

The calculation of the average power for each frequency component involves integrating the sine-squared function.

Pave = 1/(2 pi) * int(0 to 2 pi) [V * sin (theta)]^2 d(theta)
=1/(2 pi) * int (0 to 2 pi) [V^2 * 1/2 * (1 - cos(2 theta)] d(theta)

To get the rms power we integrate the square of the last integrand, which is the term in square brackets:

[V^2 * 1/2 * (1 - cos(2 theta)]^2

If we do this for each frequency component and add them up we get the rms power for the square wave.

Parseval's Theorem equates the average power of a waveform in the time domain and the sum of the spectral sine wave average power components, and that is what we are dealing with here. Parseval's Theorem would also apply to the rms power idea. In other words, it is as if we increased the amplitude of the square wave by 0.88 dB, found the rms power of each sine wave component, and then added them all up to get the equality that Parseval's Theorem requires.

The mathematics of all of this hangs together quite well and I am sure it is OK.

That's a fine argument, but it gives the wrong result for a simple square wave. Rather than searching for a flaw, I'll simply directly calculate, by definition, the average and RMS power of the example I gave in my last posting -- a square-wave current waveform through a one ohm resistor.

The current is:

+1 volt from t = 0 to omega/(4*pi)
-1 volt from t = omega/(4*pi) to omega/(2*pi)

The period is omega/(2*pi) = T

The power = (+1)^2 = +1 watt for the first half period.
The power = (-1)^2 = +1 watt for the second half period.
So the power = +1 watt over the whole period.

The average power = 1/T * Integral{t = 0 to T} of (+1) dt = 1/T * t {t = 0 to T} = 1

The RMS power = sqrt[1/T * Integral{t = 0 to T} of (+1)^2 dt] = sqrt(1) = 1

For this waveform, the average power = the RMS power. What have I done wrong in this simple calculation so it doesn't agree with your result?

No argument about some of the great suggestions I have seen, but I do have one alternate for someone trying to do this on a budget. I am making the assumption that what is needed is a 12VDC supply. One possibility is to modify a garage sale automotive type battery charger that is rated for the continuous current that you want. Usually, they have poor filtering, since they are using the battery being charged as the "filter", if you will. So, one can add capacitance to smooth out the output. These things are NOT very well regulated, so if you need a regulated supply, forget it or be prepared to do some plain and fancy modifications.

However, in any case, what you do get, for relatively cheap, is a transformer that will handle the continuous current required even if you have to build a pass transistor regulator.

BTW, one way to aquire some info is to call Motorola and ask for their "Linear and Switchmode Regulator Handbook". They will send you a copy for free. (this is a large, comprehensive book) Has gobs of different power supply designs based around all of their available regulators and schemes for high power output stuff as well. I saw a couple based on a regulator and pass transistor design that don't look too bad at all to build and would work with the above mentioned transformer. Their local phone number for Australia will be on the web. Many of the silicon manufacturers will do this sort of thing as a matter of course. I have aquired many very useful books this way for free or the cost of postage. I just happen to like the Motorola book since it is so well laid out.

Have fun and good luck to you.

Well, he's asking for a battery with rated at Amp-Hours as opposed to cold cranking amps.
An automotive battery is designed for short duration, high discharge current conditions and will perform poorly if called upon for long discharge duties. (usually will have a short life span, as well.)

An alternative to this is to buy a battery from Kmart or whatever designed to run a fish locator. These are designed for long slow discharge cycles and will last much longer under such use than a typical motorcycle battery. They are also usually gel cell batts that can be used laying on their sides or whatever, in case it needs to be tucked in a cabinet or something.

Newnes (Butterworth/Heinemann) reprinted this (Radio Designer's Guide
4th ed,? the non-US version) a year or so ago. Has anyone compared
this reprint (about $70) with the old classic book? (I can't talk the
local stores into getting a browsable copy, the Seattle bookstores
have abdicated technical book sales to Powell's, in Portland).

Also, there was a great thread on High Q inductors in sci.electronics.design
a year or two ago. Winfield Hill, the co-author of "The Art of
Electronics", was working on building some sort of equipment for a atomic
laser cooling physics experiment that needed a Hi Q tank for medium wave
frequencies. Should still be on Dejanews in the old archive.

I completely agree and said, in the first two sentences that average power was a matter for other design considerations, e.g., heat sink size, thermal conductivity, air flow, transformer size, fuse or breaker size. All these are important.

An old timer like yourself, older than dirt, ought to well remember the old 1 kW/2 kW confusion. "The power input to the final amplifier shall not exceed one kilowatt when measured using meters having a time constant of one-quarter second or less." Which meant 2 kW input, right? Gadzooks, some of those old advertisments tried to fudge that one way and another to get a 1 kW PEP Input amplifier to be a 2 kW amplifier.

Im no expert, either, but here is some stuff that I saw posted a while
back, and I was impressed enough to save the file to disc. The original
author is at the bottom. I dont think he would mind it being reposted.

Don

There are so many different kinds because each kind has characterisitics
that make it valuable in some applications. It's hard to nail
everything
down, but here are just a few guidelines that might help:

polystyrene: stable, low dielectric absorption, low distortion and high
Q,
but limited temperature range. Not generally very available new.
Polyester: same as Mylar. Almost all would be metalized, I think.
Good compromise for small size and low cost and reasonable audio
distortion performance. Useful to very low RF frequencies.
Polypropylene: Larger and higher cost than polyester, but lower
dielectric absorption and lower distortion. I've measured distortion
below -140dBc using polyprop caps in a single pole HP filter at its
cutoff freq. Polyester is maybe 20dB worse, still very good.
Ceramics
can be much worse! Because of good dielectric absorption, polyprops
are
good for pretty accurate integrators.
Ceramic: two main kinds: temp-stable and "high-K". The temp-stable
seem comparable with polyester for dielectric absorption and
distortion,
and the high-K type are much worse. The high-K also can generate
significant low freq noise when biased! Ceramics are generally very
good for RF bypassing, because they are available with extremely short
leads and low series inductance. The temp-stable kind can be among

the
best for low temp coefficient, and also are available in specific
temp coeffs.
Silver mica: larger than temp-stable ceramics generally. Do well at
RF for filtering and coupling. In some constructions, can handle a
lot of RF current. (Note: capacitors heat when AC current flows thru
them, and that limits how much current they can handle.)
Electrolytic: Aluminum and tantalum. Useful for energy storage, like
power supply filters and low-frequency bypassing on power supply lines
in circuits. Very temperature un-stable, and very high dielectric
absorption. Tantalums can be effective for bypassing frequencies up
to perhaps 1MHz.

People write whole books on capacitors...this is an extremely condensed
set of comments, and perhaps not even the most important things about
each type. Have a look in some books. I know that "Reference Data for
Radio Engineers" has a pretty good discussion of caps, and I'd be
really surprised if "The Art of Electronics" didn't have, too.

> power. So the useful quantities when calculating heating effect are
> RMS voltage, RMS current, and average power. Not RMS power.

That should be:

The reason for the confusion, I think, is that If you multiply THE
SQUARE OF THE RMS current times resistance [that is, Irms^2 * R], the
result is the average (not RMS) power, which has the equivalent
heating property I mentioned. Similarly, the SQUARE OF RMS voltage
divided by the resistance [Vrms^2 / R] equals the average (not RMS)
power. So the useful quantities when calculating heating effect are
RMS voltage, RMS current, and average power. Not RMS power.

I apologize for the error.

Thank you for your request
I did not particularly want to get philosophical when it comes to needing a large power supply.
I have a number of large power supply units constructed for the old style computers, the parts basically consist of very large transformers, capacitors, diodes, and power transistors. I have a radio that requires some 20 plus amps to drive it.
I wish to build my own 13.8 volt 25amp power supply, I am not sure how to piggy back the power diodes to allow me to draw that much current. I will then have to set up a crow bar circuit to limit the voltage output.
One of the things I am conscious of is that I may need resistors and smaller caps to make the thing run more efficiently etc etc. I did not want to go into a lot of detail about my mothers shoe size and why she had flat feet. I consider that the request was simple, does anyone have a circuit to increase the power output on a power supply?
It seemed to give people an excuse to write a whole range of philosophical shit and totally avoid the subject, I would have thought that such a simple matter would only take a Ham a few minutes to digest and come back with something.
Perhaps we have a lot of WANABE HAMS out there just cruising the net.

The miniR2 is actually my favorite now - lower diplexer loss, a more straightforward opamp for the audio section (so you can de-thump it with the usual back-to-back diode circuit in the feedback path).

Got the parts for some blocks from the "R2A" by Glen Leinweber, but haven't gotten round to it. And of course the DDS is cool to try per that QST article (link to an online version from my page).

Have fun, John K0JD

Hello!
Does anyone have a experience of using ICOM's microphones SM-20 and SM-8?
Which one give better signal quality? I guess use it with IC-756. May be
exist better choice instead of ICOM's microphone for that TRX?

Thanks

Oleg

Define "better" please.

Yes I know that teflon is easier to design with because its electrical
properties are "nicer".

But teflon is also more expensive. It seems to me that it is up to me as a
good designer, to decide the tradeoff of non-recurring expense versus
per-unit expense, considering my own situation.

From: la8ak@online.no
Message-ID: <368f8b35.55894540@news.online.no>
Source record: 75256

Have now tested the program from W6BY -
http://reality.sgi.com/employees/byee_engr/slot_ant.html using mathcad
explorer to calculate the antenna. Have drawn the modified antenna, but
a question remains, have tried to email W6BY, but the email address
byee@mti.sgi.com, does not seem to work, any change?

My question is why it is the larger 'headspace' ?
Earlier we used half wavelength from center of last slot to end wall?
The 'headspace length' differs by quarterwave (free space).

Believe I found some more basic on this design earlier, but don't find
it now, any info?

I can't give you exact numbers, but from my experience designing
a 4 pole microstrip combline filter at 3 ghz the fr-4 will have about
6db more loss the 5880 duroid. in other words fr-4 is lossy as hell
at that freq.

If you have a Network Analyzer you should try comparing FR-4 with
Teflon. you'll see how great teflon really is.

Take look at Harry's Homebrew web site, there are several easy valve
tx's & rx's. Also on a Japanese site. I can't recall the URL's off-
hand, but if you go to www.nettaxi.com/citizens/ei9gq, you will find the
links for them both.

The Japanese web site should delight you and keep your soldering iron
smoking.

Good luck,

131. FS: Collins 51J PTO & parts

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-03 00:00:00 UTC
From: k6sde@my-dejanews.com
Message-ID: <76of4n$6e6$1@nnrp1.dejanews.com>
Source record: 75260

I have a Collins 70E-15 PTO for sale. I have never fired it up but my recollection from many years ago is that it was represented as being a workable unit. It doesn't appear that the star washers on the "can" have been moved which may mean that in spite of the broken seal on it (old age?) it hasn't been opened but WHO KNOWS?

I'm asking $50 + shipping & insurance which I would think would be less than $8 or Priority Mail.

You may view several pictures of it at:

http://www.geocities.com/Heartland/Ridge/7463/51J/51jpto1.jpg

http://www.geocities.com/Heartland/Ridge/7463/51J/51jpto2.jpg

http://www.geocities.com/Heartland/Ridge/7463/51J/51jpto3.jpg

By the way, I also still have some other 51J parts left from my parts unit. IF cans, relay, switches, "protection bulb", crystals, crystal socket assembly. Ask, I may have it. However NO front panel, NO covers and NO dial drum--sorry.

Hey, THEY DON'T MAKE THESE ANYMORE! <grin>

Articles on the AWA web page + Calendar of Radio Events

To all,

The AWA Web, Page_2, has been updated for January 1999. It now
appears less cluttered.

http://www.ggw.org/awa/page_2

Additionally, there are now two AWA Old Timer's Bulletin (OTB)
articles there, complete with photos. I tried to keep the feel of the
OTB in the layout. I think you can print the articles on a laser or ink
jet and they will come out ok? I'll check from work tomorrow. Anyway,
they're on the web. Spread the word. More to come. (It takes about 3
hours to do an article, depending on the number of photos and tables.)

I broke-down and bought my own scanner so I can add OTB pages from the
past. This should be an attraction to radio buffs, and increase our
membership. It is much handier. Now I don't have to ask permission
from my kids. (My, how the tables have turned.)

The "AWA Radio Events" calendar is becoming very popular. I have
received some nice comments on it, and some new listings have arrived
due to its being there. I'm hoping this calendar will become "the one
to go to" for antique radio meets. This too will bring new people to
the AWA.

Source record: 75263

Hi Gang,

I recently acquired a TS-940SAT and want to hook it up to my shack computer. What exactly is the IF-10B?
The schematic shows a serial interface to the "Digital-A" unit, but there is no info in the manual on the IF-10B, or the RS-232C accessories. Do I need to buy these or can I build them? Does the IF-10B go inside the
940, or connect to the ACC-1 connector where the serial port is?

Any info would be appreciated. Please either respond to this newsgroup or to drepstad@together.net, my
return e-mail is not working at this time.

Now here's a guy willing to try something, and I think we should give him some support.
One problem is that the physical space inside the hole limits the size of the wiper, and thus the amount of power that can be handled. I seem to remember a design using a wiper on the outside. The wire does not have to be in intimate contact with the iron, so a form or spacer can be used to form the surface shape. Don't get carried away, as the more wire, the more loss and slightly lower Q. The other consideration is the power handling capacity of the core itself, and there someone else is going to have to chip in with some guidance. My active construction with ferrite and powdered iron ended before the current crop of materials appeared. Good luck.

> For this waveform, the average power = the RMS power. What have I done
> wrong in this simple calculation so it doesn't agree with your result?

You have done nothing wrong.

I set up a Mathcad worksheet to compare the ratios of the following integrals:

F1 = SQRT[(1/2pi) * int(0 to 2pi) V(theta)^4 d(theta)] (RMS power)
and
F2 =(1/2pi) * int(0 to 2pi) V(theta)^2 d(theta) (Average power)

I looked at the ratio in dB of F1 to F2 for a lot of various functions V(theta).

Results:

For V(theta) = sine wave I got the expected 0.88 dB. For the square wave 0 dB.

For a large number of other functions the ratio varied quite a lot. If we look at the two formulas, in retrospect, we can pretty much guess that their ratios would not be constant but
would depend on V(theta).

The discussion of Parseval's theorem is correct, but it *only* works when we compare the "average" power in the time domain of the waveform with the sum of the "average" powers of the
sine wave components that make up the waveform.

Your example was helpful in getting a better understanding. In these quick response forums, errors and imperfect understandings usually pop up that need to be corrected.

Arrange for wiping contact to wipe round the side of the toroid.

BIG PROBLEM - if wiper bridges two adjacent turns, shorts them out,
Q falls to very low value and smoke is given off.

I have an Amidon T200 dust iron core, wound with enamel copper wire,
in conjuction with a 24-way rotary switch to tap the coil at every 2
turns. But multi-way switches are very few and far between these
days.

141. Crosley 150 cabinet NEEDED

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-04 00:00:00 UTC
From: marty@netstogie.com
Message-ID: <npak2.25$pA4.5423882@IConNet>
Source record: 75072
Cross-posted to: rec.antiques.radio+phono,radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.radio.swap

This is about a 1932 dome-top (cathedral?) table superhet radio that had 3 57s (rf, 1st det. / mixer-osc., if), an 55 (2nd det, 1st audio), 43 (audio out), 80 (tld - twin light-emitting diode / rect.)

I o'hauled it's chassis 15 yr.s ago & boxed it up while owner sent cabinet out for refurb.

Well cabinetmaker vanished & now the chassis is wanting.

I have cabinet hdw. like little baffle board (for 6.5" Magnavox dynamic spkr.), knobs, & dial 'keystone' escuteon.

FYI, there were three shaft holes: tuning, volume, tone. Tuning was top of the triangular knob pattern & 'keystone' dial escuteon sat above.

This thing belongs to a close friend & I sure hope someone out there might help.

Thanks all,

Marty

No laughter! 45 years ago I worked in a research lab where my boss required an infinitely-adjustable delay line. He took a wire wound pot, dismantled it, and rewound the former with 26 swg wire, then emery-papered off the insulation round the top and re-assembled it. He also added the capacitors to ground round the outside. It worked!

> parallel stray capacitance Cs:
>
> : > : Q' = Q (1 - w^2 LCs)

Q' is the the reduced value that results from a parallel stray Cs. Q is the true Q with no Cs.

If we tune the coil to resonance with a tuning capacitor, the Q of the "tuned circuit" is Q, not Q', and the inductance is the true inductance and not the effective inductance. I believe I described all of this pretty carefully. It may take another perusal.

> And then you went on to note that the Q of a resonator built
> from that inductor and another lossless parallel capacitor was
> _not_ Q' but Q. From that I conclude that Q' must be an
> _apparent_ Q, not an _actual_ Q;

Yes, Q' is the reduced Q, caused by stray Cs. But when you tune the coil to resonance the Q is the true Q. If you meditate on that for a minute I think you

will agree.

Incidentally, I set up a Mathcad worksheet that verifies all of my statements regarding the series LRCs coil versus the parallel LRCs coil. Cs does reduce the Q to Q' in both cases.

I will not participate in this discussion any further, thank you.

Ham Radio Online is now in its 4th year, as one of the oldest, continuously published "e-zines" on the Internet. Ham Radio Online is a non-commercial (no advertising, nothing to sell) web site devoted to ham radio and telecommunications topics. Ham Radio Online is presently read in 93 countries!

Come visit us at http://hamradio-online.com

We've got lots of new stories online now, and more coming in the weeks ahead. Plus there are hundreds of articles in our massive online Library. We've just added a new mailing list feature as well with more cool stuff yet to come! And of course, we have an expanding set of links in our other sites directories, real-time propagation reports and predictions, emergency communications info and lots more.

If you see news, have an interesting story to tell, or spot an article about ham radio at another web site, drop us a line and let us know about it.

Thanks and 73,
Ed, KF7VY
kf7vy@amsat.org

Subject=3A 6 meter quad

Quick questions -

1=2E Anyone know of a website or newsgroup where cubical quad
experimenters hang out and discuss successes and failures=3F =20

2=2E Anyone have element lengths and spacings for a 4 element quad for=

50=2E200 +=2F-

3=2E Will the standard formulas 1030=2Ffreq (reflector=29 , 1005=2Ffre=
q
=28driven=29 and 975=2Ffreq (driven=29 work on 6 meters=3F

4=2E What is best way to feed this beast=3F direct with 50ohm coax=2C=
1=2F4
wave transformer=2C or gamma=3F

I have all the materials to build this quad but not sure of the
lengths and spacings=2E While reviewing Bill Orr's book "All about
cubical quads=22 (3rd edition=2C page 46=29 he shows a spacing of 10 fe=
et
between each element=2E I've read about wide spacing but that seems a
bit extreme to me=2E I have heard his formulas work well up through and=

including 10 meters but begin to fall short of the mark when you hit
50 mhz and up=2E=20

Sure would like some plans that are tried and true=2E =20

Also - would very much like to get my hands on copies of the quad
articles in the Jul 81=2C Aug 81=2C Dec 81=2C and Apr 82 all of CQ maga=
zine=2E
I'll pay for copies and postage=2E =20

Thanks for your time!!

From=3A Roy Lewallen <w7el=40teleport=2Ecom=3E
Subject=3A PEP vs RMS

That's a fine argument=2C but it gives the wrong result for a simple
square wave=2E Rather than searching for a flaw=2C I'll simply directly=

calculate=2C by definition=2C the average and RMS power of the example =
I
gave in my last posting -- a square-wave current waveform through a
one ohm resistor=2E

The current is=3A

+1 volt from t =3D 0 to omega=2F=284*pi=29
-1 volt from t =3D omega=2F=284*pi=29 to omega=2F=282*pi=29

The period is omega=2F=282*pi=29 =3D T

The power =3D (+1=29^2 =3D +1 watt for the first half period=2E
The power =3D (-1=29^2 =3D +1 watt for the second half period=2E
So the power =3D +1 watt over the whole period=2E

The average power =3D 1=2FT * Integral{t =3D 0 to T} of (+1=29 dt =3D 1=
=2FT * t {t
=3D 0 to T} =3D 1

The RMS power =3D sqrt=5B1=2FT * Integral{t =3D 0 to T} of (+1=29^2 dt=5D=
=3D
sqrt=281=29 =3D 1

For this waveform=2C the average power =3D the RMS power=2E What have I=
done
wrong in this simple calculation so it doesn't agree with your result=3F=

cos=282 theta=29=5D d=28theta=29
=3E=20
=3E To get the rms power we integrate the square of the last integrand=2C=
which is the term in
=3E square brackets=3A
=3E=20

=3E [V^2 * 1=2F2 * (1 - cos=282 theta=29=5D^2
=3E=20
=3E If we do this for each frequency component and add them up we get t=
he rms power for the
=3E square wave=2E
=3E=20
=3E Parseval's Theorem equates the average power of a waveform in the t=
ime domain and the sum
=3E of the spectral sine wave average power components=2C and that is w=
hat we are dealing with
=3E here=2E Parseval's Theorem would also apply to the rms power idea=2E=
In other words=2C it is as
=3E if we increased the amplitude of the square wave by 0=2E88 dB=2C fo=
und the rms power of each
=3E sine wave component=2C and then added them all up to get the equali=
ty that Parseval's Theorem
=3E requires=2E
=3E=20
=3E The mathematics of all of this hangs together quite well and I am s=
ure it is OK=2E
=3E=20

FREE EAST TIMOR wrote=3A

=3E I have a 5 amp power supply and I would like to increase the power =
output to
=3E approx=2E 30 amps=2E I believe this is done using the 3055 power tr=
ansistors=2C
=3E could some-one please draw me a circuit or explain where I can find=
a
=3E circuit to allow me to build this thing
=3E Laurens

No argument about some of the great suggestions I have seen=2C but I do=
have one
alternate for someone trying to do this on a budget=2E I am making the=
assumption
that what is needed is a 12VDC supply=2E One possibility is to modify =
a garage
sale automotive type battery charger that is rated for the continuous c=
urrent
that you want=2E Usually=2C they have poor filtering=2C since they are=
using the
battery being charged as the "filter=22=2C if you will=2E So=2C one ca=

n add capacitance
to smooth out the output=2E These things are NOT very well regulated=2C=
so if you
need a regulated supply=2C forget it or be prepared to do some plain an=
d fancy
modifications=2E

However=2C in any case=2C what you do get=2C for relatively cheap=2C is=
a transformer
that will handle the continuous current required even if you have to bu=
ild a
pass transistor regulator=2E

BTW=2C one way to aquire some info is to call Motorola and ask for thei=
r "Linear
and Switchmode Regulator Handbook=22=2E They will send you a copy for =
free=2E (this
is a large=2C comprehensive book=29 Has gobs of different power supply =
designs based
around all of their available regulators and schemes for high power out=
put stuff
as well=2E I saw a couple based on a regulator and pass transistor des=
ign that
don't look too bad at all to build and would work with the above mentio=
ned
transformer=2E Their local phone number for Australia will be on the w=
eb=2E Many
of the silicon manufacturers will do this sort of thing as a matter of =
course=2E
I have aquired many very useful books this way for free or the cost of =
postage=2E
I just happen to like the Motorola book since it is so well laid out=2E=

Have fun and good luck to you=2E

From=3A fisherjr=40ionet=2Enet (John & Ruthann Fisher=29
Subject=3A 6 meter quad

Quick questions -

1=2E Anyone know of a website or newsgroup where cubical quad
experimenters hang out and discuss successes and failures=3F =20

2=2E Anyone have element lengths and spacings for a 4 element quad for=

50=2E200 +=2F-

3=2E Will the standard formulas 1030=2Ffreq (reflector=29 , 1005=2Ffre=
q
=28driven=29 and 975=2Ffreq (driven=29 work on 6 meters=3F

4=2E What is best way to feed this beast=3F direct with 50ohm coax=2C=
1=2F4
wave transformer=2C or gamma=3F

I have all the materials to build this quad but not sure of the
lengths and spacings=2E While reviewing Bill Orr's book "All about
cubical quads=22 (3rd edition=2C page 46=29 he shows a spacing of 10 fe=
et
between each element=2E I've read about wide spacing but that seems a
bit extreme to me=2E I have heard his formulas work well up through and=

including 10 meters but begin to fall short of the mark when you hit
50 mhz and up=2E=20

Sure would like some plans that are tried and true=2E =20

Also - would very much like to get my hands on copies of the quad
articles in the Jul 81=2C Aug 81=2C Dec 81=2C and Apr 82 all of CQ maga=
zine=2E
I'll pay for copies and postage=2E =20

Thanks for your time!!

=3E > special application=2E
=3E >

Well=2C he's asking for a battery with rated at Amp-Hours as opposed to=
cold cranking
amps=2E
An automotive battery is designed for short duration=2C high discharge =
current
conditions and will perform poorly if called upon for long discharge du=
ties=2E (usually

```
will have a short life span=2C as well=2E=29

An alternative to this is to buy a battery from Kmart or whatever desig=
ned to run a
fish locator=2E These are designed for long slow discharge cycles and =
will last much
longer under such use than a typical motorcycle battery=2E They are al=
so usually gel
cell batts that can be used laying on their sides or whatever=2C in cas=
e it needs to be
tucked in a cabinet or something=2E

From=3A Roy Lewallen <w7el=40teleport=2Ecom=3E
Subject=3A PEP vs RMS

That's a fine argument=2C but it gives the wrong result for a simple
square wave=2E Rather than searching for a flaw=2C I'll simply directly=

calculate=2C by definition=2C the average and RMS power of the example =
I
gave in my last posting -- a square-wave current waveform through a
one ohm resistor=2E

The current is=3A

+1 volt from t =3D 0 to omega=2F=284*pi=29
-1 volt from t =3D omega=2F=284*pi=29 to omega=2F=282*pi=29

The period is omega=2F=282*pi=29 =3D T

The power =3D (+1=29^2 =3D +1 watt for the first half period=2E
The power =3D (-1=29^2 =3D +1 watt for the second half period=2E
So the power =3D +1 watt over the whole period=2E

The average power =3D 1=2FT * Integral{t =3D 0 to T} of (+1=29 dt =3D 1=
=2FT * t {t
=3D 0 to T} =3D 1

The RMS power =3D sqrt=5B1=2FT * Integral{t =3D 0 to T} of (+1=29^2 dt=5D=
=3D
sqrt=281=29 =3D 1

For this waveform=2C the average power =3D the RMS power=2E What have I=
done
wrong in this simple calculation so it doesn't agree with your result=3F=

Roy Lewallen=2C W7EL

ne watt=2E
=3E > Both the average and RMS values of this waveform are one watt=2E
=3E=20
=3E The "average power=22 is equal to the "peak power=22 of the square =
wave and the rms "voltage=22
=3E is equal to the "peak voltage=22 of the square wave=2E Average powe=
r is *always* rms voltage
=3E squared (if R=3D1 ohm=29=2E
=3E=20
=3E If you decompose the square wave (or any other wave=29 into its fre=
quency components=2C and
=3E calculate the average power in each component=2C and then add all o=
f these up=2C you get the
=3E wave average power=2E If you do the same thing with the rms power c=
omponents you get the rms
=3E power (not the average power=29 of the wave=2C which is 0=2E88 dB h=
igher=2E
=3E=20
=3E The calculation of the average power for each frequency component i=
nvolves integrating the
=3E sine-squared function=2E
=3E=20
=3E Pave =3D 1=2F=282 pi=29 * int=280 to 2 pi=29 [V * sin (theta=29=5D^=
2 d=28theta=29
=3E =3D1=2F=282 pi=29 * int (0 to 2 pi=29 [V^2 * 1=2F2 * (1 - =
cos=282 theta=29=5D d=28theta=29
=3E=20
=3E To get the rms power we integrate the square of the last integrand=2C=
which is the term in
=3E square brackets=3A
=3E=20

=3E [V^2 * 1=2F2 * (1 - cos=282 theta=29=5D^2
=3E=20
=3E If we do this for each frequency component and add them up we get t=
he rms power for the
=3E square wave=2E
=3E=20
=3E Parseval's Theorem equates the average power of a waveform in the t=
ime domain and the sum
=3E of the spectral sine wave average power components=2C and that is w=
hat we are dealing with
=3E here=2E Parseval's Theorem would also apply to the rms power idea=2E=
In other words=2C it is as
=3E if we increased the amplitude of the square wave by 0=2E88 dB=2C fo=
und the rms power of each
=3E sine wave component=2C and then added them all up to get the equali=
ty that Parseval's Theorem
=3E requires=2E
=3E=20
=3E The mathematics of all of this hangs together quite well and I am s=
ure it is OK=2E
=3E=20
=3E Bill W0IYH

FREE EAST TIMOR wrote=3A

=3E I have a 5 amp power supply and I would like to increase the power =
output to
=3E approx=2E 30 amps=2E I believe this is done using the 3055 power tr=
ansistors=2C
=3E could some-one please draw me a circuit or explain where I can find=
a
=3E circuit to allow me to build this thing
=3E Laurens

No argument about some of the great suggestions I have seen=2C but I do=
have one
alternate for someone trying to do this on a budget=2E I am making the=
assumption
that what is needed is a 12VDC supply=2E One possibility is to modify =
a garage
sale automotive type battery charger that is rated for the continuous c=
urrent
that you want=2E Usually=2C they have poor filtering=2C since they are=
using the
battery being charged as the "filter=22=2C if you will=2E So=2C one ca=

n add capacitance
to smooth out the output=2E These things are NOT very well regulated=2C=
so if you
need a regulated supply=2C forget it or be prepared to do some plain an=
d fancy
modifications=2E

However=2C in any case=2C what you do get=2C for relatively cheap=2C is=
a transformer
that will handle the continuous current required even if you have to bu=
ild a
pass transistor regulator=2E

BTW=2C one way to aquire some info is to call Motorola and ask for thei=
r "Linear
and Switchmode Regulator Handbook=22=2E They will send you a copy for =
free=2E (this
is a large=2C comprehensive book=29 Has gobs of different power supply =
designs based
around all of their available regulators and schemes for high power out=
put stuff
as well=2E I saw a couple based on a regulator and pass transistor des=
ign that
don't look too bad at all to build and would work with the above mentio=
ned
transformer=2E Their local phone number for Australia will be on the w=
eb=2E Many
of the silicon manufacturers will do this sort of thing as a matter of =
course=2E
I have aquired many very useful books this way for free or the cost of =
postage=2E
I just happen to like the Motorola book since it is so well laid out=2E=

Have fun and good luck to you=2E

Yah, you can, but the crystal will still continue to age after you are done. All you will do is decrease the lifespan somewhat. If you need very tight stability, perhaps you might wish to consider the idea of an oven controlled oscillator or some other high stability crystal control circuit.

This is not correct. I can't do all the math on it right now (got to
run), but root-mean-square doesn't work this way.

This also doesn't look right, though now I'm having so much trouble
(Bill, too, I guess) with representing this kind of math in em-mailable
ASCII that I'm not sure.

Sigh ...

Jamming cellphones would be ILLEGAL. Unless your nearest neighbor is
thousands of feet away, there's no way to gurantee you're not jamming
him too.

I'm always amazed that people who lose control of their lives
are perfectly willing to do illegal/dangerous things to indirectly
enforce wishes that they're unwilling/afraid to ask for.

All you gotta do is tell them to turn off their phones or leave.
You can then be tightly puckered all alone. God forbid your phone
should ring...better cut the wire. Do it now, the voltage is lower
when you're online.

Neighbor has a heart attack. They can't call 911 'cause you're
jamming....I'd like to be the lawyer prosecuting you on that one...I
could retire.

152. wtb 150pf air variable

154. Re: PEP vs RMS

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-04 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <36916B21.166E3858@teleport.com>
Source record: 75085

Actually, I did make an error, but it fortunately didn't affect the result. I inverted the period. The correct definition of the current waveform is:

+1 volt from t = 0 to pi/omega
-1 volt from t = pi/omega to (2*pi)/omega

The period is (2*pi)/omega = T

Because the result is true regardless of the period, the error has no effect on the result. My apology for the error.

Out of curiosity, I calculated the ratio of RMS to average power for a zero-average rectangular current wave of arbitrary duty cycle D, flowing through a resistance. (D is the fraction of the period that the current wave is positive. You get the same result, of course, if it's defined as the fraction of the period that it's negative, or if it's a voltage instead of current wave.) The positive and negative current or voltage values were adjusted to keep the average value of the current or voltage waveform equal to zero as D varied. (That is, Ap/An = (1-D)/D where Ap and An are the amplitude of the positive and negative parts of the wave, respectively, and D is the fraction of the period the wave is positive.)

Unless I goofed up my math (a distinct possibility, as I keep proving), the ratio of RMS power to average power for this current or voltage wave is

sqrt{(1-3D+3D^2)/[D(1-D)]}

For a low duty cycle (D<<1), this is about equal to 1/sqrt(D). So the RMS power becomes much greater than the average power for a skinny rectangular current or voltage wave. Because a typical audio waveform, at least a speech waveform, has a high peak-average ratio like this, I'd expect it to also have a considerably higher RMS than average value. Consequently, an audio (or RF) amplifier manufacturer could claim an RMS power capability much greater than the average power it could handle. The amplifier's dissipation, though, would be determined by the average power, and the peak output capability as well as maximum voltage and current stress by the peak power. So RMS power would again serve no useful function other than enhancing advertising claims.

-- Thanks very much to the several people who emailed me with information about how to get a Radiotron handbook. I'll have one soon!

155. Re: Question about high Q inductor

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-04 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <369171EE.6F8376D9@teleport.com>
Source record: 75086

It looks like three values of Q might be getting into the discussion. One is the Q of the LR portion of the circuit*, with no C. I'm going to call it "LR Q" (Bill's "true Q") for lack of a better term. (I don't like "true Q" for the following reason. A pure inductance has no resistance, so by definition has infinite Q. A real inductor has both resistance and capacitance. So why would a Q value which includes one but neglects another unavoidable characteristic of a real component be more "true" than one which includes both the unavoidable R and C?) Another is what I'd like to call the "component Q", (Tom's Q'') which is Terman's definition, and can in theory be determined by a single measurement of the physical inductor. ("Inductor Q" might be technically correct for this but could be confused with the Q of the LR alone.) Finally, Bill refers to a "circuit Q" which is the Q of a circuit which includes the component plus a resonating capacitor. It's not immediately obvious to me whether this would fit either of the previous Q definitions, or whether it would have a third value.

So far, I've convinced myself that if you resonate the inductor with a capacitor, measure the bandwidth and center frequency of the resulting circuit, and calculate Q as the center frequency divided by the bandwidth, you get the "LR Q". This, of course, doesn't change with inductor capacitance, so by itself won't tell you how the inductor would behave in a circuit. Terman's definition is the equivalent series reactance divided by the equivalent series resistance of the physical component -- or what I dubbed "component Q". (It also equals the equivalent parallel resistance divided by the equivalent parallel reactance of the component.) This decreases as coil stray capacitance increases, and will tell you how the component would behave over a narrow frequency range, provided the frequency is well below self-resonance.

It would seem that both the "LR Q" and "component Q" would be useful. The former can be used in representing the LR portion of a model inductor, where the capacitor is modeled as a separate element. The latter could be used in a simplified LR model for a real inductor, over a narrow frequency range well below self-resonance.

At least I know now what I'm measuring. A simple, direct, and reliable way to measure the "component Q", without separately determining the capacitive part, would be nice. A direct measurement using an impedance bridge doesn't work well for most of the inductors I'm interested in because of limited resolution in the range of interest. Wes Hayward, W7ZOI has suggested a method based on amplitude that might give this information. I'll run through the math and see when I get some time.

*The model I've been using is a series LR, with shunt C across the
series combination.

That's an odd request. You will obviously have to go to the
manufacturer of the chip for any information such as that.

Hi -

I had an e-mail that there was a thread on this newsgroup about the R2 revision. I'll let you know what I know at this point, and as I get more info from Rick I will post more....

Rick is re-designing the PC board to have the same footprint as the miniR2, T2, and LM-2, and to improve performance. The only component change I know of for sure is the change from the SBL-1 dbm's to the TUF-1's. To reduce the size of the board I am sure there are more but I don't know what as yet. The prototype of the new board should be received shortly, and the production board should be available around the end of the month.

I have asked Rick to fill me in on a few more of the details so I can pass them on, and so I can be sure I am set with a stock of parts when the boards arrive.

I'll post more when I know more....

160. Re: Speedup Xtal aging ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-04 00:00:00 UTC
From: Douglas Cole <dcole@ior.com>
Message-ID: <36919949.4C7344B7@ior.com>
Source record: 75091

I read an excellent article on aging of crystals and aging of rubidium oscillators and how you can have a very accurate crystal osicillator just by letting the unit run powered up continously , after a certain period the crystal will stabalize to a point where as long as power is not removed from the circuit it will stay at that point (I am grossly oversimplifing of course) and all you should have to do is net your frequency after a time of stabalizing and it will not drift much at all, they also have found that after netting , if you remove power from the circuit it will "rubberband " back and you will have to re-net it.....

Now I know that I haven't given a technically correct explanation of this but I know it works, because I had built a packet repeater and had troulbes with the tx frequency drifting and never stabilizing (the oscillator was switched on and off with the tx line) so I applied continous dc to the circuits before the driver output to the PA and after a period of on time I netted the frequency and it has stayed put for the last 3.5 years!

And then later I read this in a trade magazine (MRT or some such) ,so to see it in a tech book made me feel that much better about what I had experienced......

Anyway if you want I can get a copy of the article for you , it goes into great detail , mostly about why its not always necessary to use a rubidium standard......

Let me know if your interested....

The error in this has been corrected in my most recent post. If we compare the average
power in
the time domain with the sum of the average powers in the spectrum components then the
equality
shows up. This is Parseval's Theorem. But it doesn't work for rms power.

> > To get the rms power we integrate the square of the last integrand, which is the term

This is OK, but as we agreed before, we have to take the square root after doing the
integration.
This term uses the trig identity:

[sin(th)]^2 = 1/2 [1 - cos (2th)]

My Mathcad worksheet experiment revealed the facts about Prms vs Pave for various
waveforms.

165. Looking for a white noise generator

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-04 00:00:00 UTC
From: red_strider@my-dejanews.com
Message-ID: <76poau$7l1$1@nnrp1.dejanews.com>
Source record: 75193

This last set of holidays has taught us a few things, one major thing is that cell phones are both a blessing and a curse.

This last x-mas we had cell phone madness, and I want a way to make it stop for at least the time it takes us to have our bit of family get togethers.

So I am looking for a way to white noise out cells phones from receiving and sending, but only for a home sized area... something I can flick on and off when needed during the holidays is best.

Ideas? Suggestions on how to accomplish this?

166. 6 meter quad

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-04 00:00:00 UTC
From: fisherjr@ionet.net
Message-ID: <76pk9bcle1@ionews.ionet.net>
Source record: 75194

Quick questions -

1. Anyone know of a website or newsgroup where cubical quad experimenters hang out and discuss successes and failures?

2. Anyone have element lengths and spacings for a 4 element quad for 50.200 +/-

3. Will the standard formulas 1030/freq (reflector) , 1005/freq (driven) and 975/freq (driven) work on 6 meters?

4. What is best way to feed this beast? direct with 50ohm coax, 1/4 wave transformer, or gamma?

I have all the materials to build this quad but not sure of the lengths and spacings. While reviewing Bill Orr's book "All about cubical quads" (3rd edition, page 46) he shows a spacing of 10 feet between each element. I've read about wide spacing but that seems a bit extreme to me. I have heard his formulas work well up through and including 10 meters but begin to fall short of the mark when you hit 50 mhz and up.

Sure would like some plans that are tried and true.

Also - would very much like to get my hands on copies of the quad articles in the Jul 81, Aug 81, Dec 81, and Apr 82 all of CQ magazine. I'll pay for copies and postage.

Thanks for your time!!

One catch with Teflon is that it is difficult - in practice impossible - tomake
multi-layer boards (four or more) with the stuff. I've used
acrylate-bonded teflon cloth as the outer layers of 6-layer boards,
and Rogers now has several board materials that offer more or
less comparable performance over a range of prices.

Try Toys-R-Us. They sell 6v lead-acid batteries for those child-sized electric cars. You can get 6 and 12 volt varieties. Capacity runs around 6 Ah. Price is about $25, depending on voltage and capacity.

I bought a batch of silver-mica caps (from Dan's Small Parts) a while ago. I also have an AADE LC meter (model IIB, I think). I read numerous messages about silver micas not really being temperature stable.

So, I got a can of freeze spray, and an incandescent light, and measured a few of my silver micas after alternately heating and cooling them. I didn't write any numbers down, but measured values were more or less rock solid and didn't vary measurably, modulo the repeatability of the test.

I also tried hitting the cap with freeze spray while it was in the test "fixture". No change.

I'll try to redo this and actually write some numbers down. Don't have any way of reliably measuring the cap's temperature, but I'll try to standardize the cooling and heating times and conditions.

Am I missing something? Is there some glaring flaw in my test? Or, are some silver micas simply better than others? I freely admit that there isn't any solid data here, and my procedure was fairly slapdash, but I did see measurable (several pF to tens of pF) variation in other, non-NPO ceramics and random other caps.

I'm not surprised at your results. But if you build an oscillator using the different types of capacitor in the tank circuit and measure the frequency with a counter or receiver, you'll make a much more sensitive measurement. If a capacitor changes value by, say, 0.1%, it would cause a 10 MHz VFO to move 5 kHz, which most folks would consider unacceptable for a moderate temperature change. But you're not likely to be able to see this much change on your meter.

If your application can tolerate the smallest amount of drift that you can see with your measuring system, silver micas and NPOs will be equally good. The only common application where you're likely to see a difference is in a VFO, or perhaps an extremely narrow filter.

The principle that Charles refers to is, I beleive, that if the feedline has a resistive termination you should be able to derive SWR from coefficient of reflection. It will have to be resistive at all frequencies however. This immediately rules out testing antennas.

Has anyone a reference to homebrewing rotary toroidal
inductors?

I was thinking of trying my hand at building a balanced
L network, but find the price and availability of roller
inductors was such as to make one consider alternatives.

I was thinking of 2 x 200-6 powdered-iron cores, with
#14 wire turns, and some sort of spring-loaded wiper
inside the toroid making contact with the wire.

That's pretty well where my imagination peters out.

Any suggestions, howls of derisive laughter, detailed
CAD drawings or references?

The technologically simple solution is to just have everyone turn off
their cellphones. It's your home - can't you declare it a
cellphone-free zone? If you can suggest this and get everyone to do
it, then no technology is necessary.

And if there are some members of your family who would *not* be willing
to turn off their cellphones voluntarily, how do you think they are
going to feel and behave when they find out that you are jamming their
cellphones? This is *not* likely to contribute to family harmony.

Technically, it's probably not difficult to jam the paging channels
from cell sites near your home, so the phones can't receive information
from the network. If they can't receive data, they can't receive or
initiate calls. However, the "No Service" indicators on the phones
will light up, so people will know something is wrong.

Motorola makes some ICs in the 145nnn series that are single chip PLL devices, but do not include the voltage controlled oscillator. I do not remember the ratings so you may also need a prescaler. I know it is needed at 120 MHz. There is one that has a 12 bit parallel input, if I remember correctly. This could be used with a diode matrix or 12 pole rotary switch.

There are newer devices made for the wireless telephone industry that contain everything, including the VCO, but they will probably need an 'on board computer'. They are also surface mount devices which are more difficult to homebrew. The 145nnn series are available as DIPs.

Look at the various internet sites for companies like Motorola, Plessey, Philips, etc.

Keith Brigode wrote in message <368EE461.238082@ibm.net>...
>I'll admit some ignorance. Why are mylar capacitors used sometimes as
>bypass capacitors instead of ceramic?
>
The simple answer is that the ceramic capacitors are not available in the values needed. Mylar capacitors are usually used to bypass lower frequency signals, so a larger value capacitor is needed, on the order of microfarads or tens of microfarads. Ceramic capacitors are almost always much smaller than microfarad and are used at higher frequencies.

>When do I use aluminum eletrolytic as apposed to tantalum?
>
Tantalum capacitors are usually used where you want a relatively high value of capacitance that can be used over a relatively 'large' frequency range, such as in a high quality audio circuit. Aluminum electrolytics are usually used in power supply circuits. Also, power supply voltage is a concern. I don't recall ever seeing a 450 volt tantalum, for example.

Quite often you will see a tantalum (10 to 20 uF) in parallel with a ceramic (.001 to .01) to bypass a
low voltage (5-15 volt) three terminal regulator.

>What do I use to replace old paper capacitors in old radios?
>
Sounds like you have an old radio that you are fixing up. I would suggest using Mylar for the high voltage ones in the 'radio' part of it for moderate values of capacitance. The Sprague 'Orange Drop' series are a good choice. Unless there is obvious signs of damage the ceramics should still be good. For larger values, such as in the power supply section, modern electrolytics are OK.

I am sure that there are others on here that are more knowledgable than I on this topic.

>Could someone refer me to some good reference on capacitors? I really

: > increase, the Q apparently increases...

: Not true, and there is a simple way to see this. And above all I
: would suggest keep everything simple
: and not get into a quagmire of electromagnetics and energy/power
: arguments. Circuit analysis is all
: that is needed for this problem. Q implies an energy relation and
: it is only necessary to think in
: terms of Q in the circuit analysis.

: If the coil is a series Rs and Xs, and if the coil Q is, say 10 or
: more, then the coil, considered
: "all by itself" (ignore for the moment Cs) can be converted into a
: parallel Rp and and a parallel Xp
: whose values are very nearly given by the following:

: Rp = wL * wL/Rs = wL * Q

: Xp = wL

: We now have virtually the same situation that I described
: previously and the addition of stray
: capacity Cs reduces the Q in the same way as before.

All after what??

In the previous posting, it seems like you were saying that
there is a new Q, which you called Q', which resulted from
parallel stray capacitance Cs:

: > : Q' = Q (1 - w^2 LCs)

And then you went on to note that the Q of a resonator built
from that inductor and another lossless parallel capacitor was
not Q' but Q. From that I conclude that Q' must be an
apparent Q, not an _actual_ Q; or else the actual Q of an
inductor depends on the circuit topology around it. (Or else
the simple model of a single parallel capacitance is flawed...)

If that was not what you intended originally to say, or if it leaves too much to the imagination, perhaps you could find different words to more accurately communicate the situation. An example of a _resonator_ in which Q' applies, and not Q, would be helpful, for instance.

--
Cheers,
Tom
tom_bruhns@hp.com

(I'll be happy to leave fields out of the situation. I just would like to be able to understand from any explanation exactly what the losses are in the resonator versus the stored energy; then I will know the Q. And I'm happy enough assigning a Q to individual components, realizing that this is an extrapolation from the basic definition of the Q of a resonator involving energy. Energy isn't at all a quagmire to me, thank you. For the simple model of a parallel Cs, I would agree with the interpretation that Q' is only an apparent Q, and the actual Q is unchanged by Cs. But is the simple model adequate? Clearly that model doesn't predict anything interesting above the first parallel self resonance, but yet there are interesting things that go on there.)

Red OM,

Pardon my incredulity, but all you need to do is turn off all the
cellular
phones in your house (it is YOUR house, isn't it?).
73,
Don, W6JL

increase
>the power output on a power supply?

I didn't see your original request, but the simple answer is that you can not get more power out of a supply than is fed into it. If you want 345 watts out (13.8 x 25) you are going to be drawing at least 345 watts from the wall socket. This is simple physics...there is no way around it.

You will, in fact, be drawing more than 345 watts from the electric plug because of the inefficiency of the power supply. The amount of power available will be limited by the weakest component in the supply, which hopefully will be the fuse. All other components will have to be appropriately rated.

I do not know what you mean by 'piggy back the power diodes', but putting them in parallel is not suggested. There are single diodes available that will do the job. Sometimes diodes are put in series to increase the voltage handling capability. In either case you will still need a transformer that can supply the power.

I assume you do not really mean 'crow bar'. A crow bar circuit is used to shut off the power supply if something goes wrong causing the voltage or current to go too high. What you need is a regulator that will keep the voltage at a constant level. The simplest that I can think of will need a 3 terminal regulator (type 7812), 3 or 4 hefty transistors, a handfull of resistors, and a few capacitors.

Try checking around the internet. There may be some web sites with detailed designs on power supplies. Or look at the ARRL or RSGB (what is the AU equivalent?) handbooks.

186. Re: Question about high Q inductor

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-05 00:00:00 UTC
From: tomb@lsid.hp.com
Message-ID: <76rm1f$15r@hpcvsnz.cv.hp.com>
Source record: 75093

OK, a little while ago I posted:

(section deleted...)

: And then you went on to note that the Q of a resonator built
: from that inductor and another lossless parallel capacitor was
: _not_ Q' but Q. From that I conclude that Q' must be an
: _apparent_ Q, not an _actual_ Q; or else the actual Q of an
: inductor depends on the circuit topology around it. (Or else
: the simple model of a single parallel capacitance is flawed...)

Another way to look a things: If you define Q in terms of
the Q of a resonator built from some inductor with its inherent
strays, then it seems to me that the inductor Q should be just
Q, not the Q', so the Q is unaffected by the stray capacitance...
at least in the simple "lump all the C into one shunt C value"
model.

However, you _could_ also "define" inductor Q (just to
distinguish, let's call it Q'') as ratio of the reactive
part to the resistive part of the impedance of the coil
(with all its strays included) at some frequency omega
(w) = 2*pi*f. If you model the coil with parasitics as an
ideal inductor in parallel with an ideal capacitor and an
ideal resistor, then the Q'' defined as reactive part of
impedance divided by resistive part of impedance is:

Rp * (1 - w^2*L*C) / (w*L)

and obviously as C goes to zero, this goes to the classic R/wL.
If you model the coil with its parasitics as an ideal inductor
in series with an ideal resistor, and that paralleled by an
ideal capacitor, the result is slightly different:

w*L * (1 - Rs^2*C/L - w^2*L*C) / Rs

(Note: Rp and Rs are used to distinguish between modelling the
loss as a parallel or series resistor.) This one reduces to
wL/R, as C goes to zero, as expected. Each of these two models
reduces to the "well-known" formula for inductor Q if you let C
go to zero. (With luck, I haven't made any algebra or
transcription mistakes in all that.)

But my always-implied, sometimes-stated question remains:
is the reactance/resistance "definition" of Q'' really useful?
Can I build a resonator with that coil by adding only a
capacitance and no other losses, in which I will see resonator

Q equal to Q''? If not, what do I do with Q''?

I'm jumping into this thread kinda late...
I've never done any serious comparison, but have built a few little VFO circuits and found the polystyrene caps to be very stable. To those of you who have actually made serious comparisons, how do the polystyrenes stack up against silvered-micas in such an application?

-Bill M WX4A

Hello, Oleg

I'm using an SM-20 with my 756, and get good audio reports. I did some on-air comparisons with the stock hand-mic, and a couple other mics I had lying around here, and the SM-20 was a clear winner. But I do not have a SM-8 available for comparison. I don't think I would have spent that much money myself, but it was a Christmas present from my wife. Besides, it looks nice.

I have 10 cde Electrolytic Capacitors value of 220uf @ 450wv. They are
General purpose aluminum snap in type radial lead with temp range of
-40 to 85+. The size is 1 1/4 dia by 1 1/2 inch long with tabs out the
end of 1/4 inch. They are can shaped. They are like new and have been
checked for cap and leakage. $3.00 ea plus shipping

>

Douglas,

Since you did not say if you had any Windows programming experience at all I will assume you don't have any for my following comments.

Windows uses an "event driven programming model" using "messaging passing" which is very different from the "procedural programming model" you are familiar with from doing FORTRAN and COBOL programming. This means that everything on the screen is "live" such as menus, buttons etc. Windows passes messages to every section of code (attached to a menu item etc.) that performs some action. Each of these code sections must check to see if the current program state makes sense for the action to occur. If nothing is done by the current code section then the messages are passed on to the next code section. As you can see, this type of model does not allow a completely predetermined or controlled sequence through the program code. This description is a very-very basic idea of what goes on inside of even a simple Windows program.

The really bad thing from your point of view will come from the fact that Windows, and not you, controls the hardware in the computer. There is none of the DOS world crap where you just grab whatever hardware resource(s) you need. There is a way around this buy using Windows hardware device drivers supplied by Windows or written by yourself. Writing Windows device drivers is something even professional programmers would prefer not to even think about.

Finally you will most likely be working with some sort of software development environment to do your work in. These development environments can be a great help is doing some of the basic tasks in getting a "minimal" Windows program up and running. What you will find however is another layer of complexity you will need to learn along with the development environment

itself.

I don't mean to scare you with the above comments. I just want to point out to you that what you want to do will require a significant about of your time and a lot of effort. Many people have done it and have written some very good programs so I am sure you can. I would say go for it. If you run into problems Microsoft has their own news server with NGs to cover just about anything you can think of for programming in Windows. When you have any questions I would suggest that you check there.

John:
Excellent job, ... and all schematics are very readable (my figure of merit of a good web site). Please continue to include past articles. I subscribed not too long ago, and really miss to opportunity to read past articles. Unfortunately, no OTB Review (like QST View) is available, and not many past issues can be purchased.

195. Re: Silver Micas Vs NPOs

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-05 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <3691C989.E3C4CB88@teleport.com>
Source record: 75102

I haven't directly compared silver micas to polystyrenes because the former vary from manufacturer to manufacturer (and maybe from lot to lot). But I did compare some polystyrenes to NPOs. The polystyrenes have a fairly low positive temperature coefficient, but one that's noticeably higher than an NPO. The inductors I've made, anyway, tend to have a negative temperature coefficient, and the tempco of a good one is less than that of a polystyrene capacitor. If you make a fairly poor inductor, you can sometimes get lucky and cancel its tempco with a polystyrene capacitor. The approach I like to take, though, is to begin with the best inductor I can (just about a full single layer on a type 6 powdered iron core) and the lowest tempco capacitor (NPO), then compensate what's left. The VFOs I build with this combination pretty repeatably have about 200 Hz warmup drift at 7 MHz, with no compensation at all. Because it's repeatable, compensation would be pretty easy, but I haven't found it to be worth the bother.

You might find it enlightening to separately spray each component in the VFO with spray cold to get an idea of about how much drift is due to each component, and in which direction. In the ones I build with NPO capacitors, the inductor is always the dominant source of temperature drift.

I have used a BD139 at 50Mhz with 5watts out from 500mW drive as the PA
to my transvertor. Not bad for an Audio device! I am now using a VN88AFD
mosfet, not quite as cheap, needs more volts but nice and stable, now
QRO at 10 watts.

Inherrent good quality silver micas are about +40 to +100 ppm/deg c but
for low values the fringing field means that the dylectric of the
potting material comes in and give a worse tc and loss angle.
NPO ceramic are specified as +-30ppm/deg/c and are doped for minimum tc.
there are also porcelain npo that have lower loss at UHF chip caps
because of their absence of potting could be better though low values
will include board Tc as part of their overall performance.
Polystyrene are also good if unencapsulated but vulmerable to solder
damage.

Stuart

I did a 6 meter synth using the MC145170 which is a serially programmable synthesizer. The details are available on my website. The source code for a PIC16C57 is also there. I have to admit the circuit only <sortof> worked and stability was a problem
However it might serve as a starting point for your deliberations. For my own education I attempted to write an article on PLL design and what I had discovered from various sources which is also on the site. Unfortunately all current designs use a microcontroller to drive the PLL. You might be able to use something like a BASIC stamp which isnt too hard to program so I understand. If you want to use a diode matrix or EPROM you have to go to one of the older PLL chips such as the MC145151 which will need a prescaler at 50 MHz (note that the MC145170 does not.) There are newer PLL chips (eg from Phillips) that even have the loop amp/filter built in Bear in mind that PLL design is not for the faint hearted but with persistence it should work.

199. Re: Speedup Xtal aging ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-05 00:00:00 UTC
From: Tom McDermott <mcdermot@NOSPAM.aud.alcatel.com>
Message-ID: <36921B44.D96ACA89@NOSPAM.aud.alcatel.com>
Source record: 75106

Most of the drift of crystal oscillators is caused by power-supply
variationand temperature variation. Once those effects are fixed, then
crystal aging
can be the next smaller effect to look at.

For our commercial products, we used to purchase 'aged' crystals. These
had
been burned-in for several weeks at elevated temperature before being
shipped
to us, and we found that it tended to improve the aging characteristics
of the
crystals. Discussion with the manufacturer indicated that the physical
causes
of crystal drift were not that well understood, but that it appeared to
be at
least related to stress in the crystal and diffusion of the plated
metallic surface
contact (usually silver?) into the crystal surface. First-order
diffusion usually is
proportional to temperature and proportional to the square-root of time.

The aging characteristics we saw could have either poistive or negative
sign,
and the slope wold often change throughout the course of the
measurement,
leading to the technical conclusion that we didn't exactly know what in
the
world was going on! Simulation of the aging would appear to be futuile
if the
cause(s) are not well known.

However, burning-in the crystals at elevated temperature did seem to
more
rapidly take us down the aging curve, and to answer your question
directly, that's
the only approach I am aware of.

I too have used FR4 over the past several years in some areas that FR4 would not have been used in say 10 years ago. (2-3 GHz range). Cost and need for high layer count were the primary drivers. A couple of important things about designing RF (stripline and microstrip) with FR4 compaired to some of the other laminates....

FR4 is really a mix of two different dielectric materials, the glass part (which has a dielectric constant of about six which is also fairly constant from DC up to several GHz), and the resin part (whose dielectric constant varies consideraby from vendor to vendor and also changes dramatically with frequency). Thus depending on what the glass to resin ratio is in the board, one can build a FR4 board with a fairly wide range of "finished dielectric constant" and which also varies as a function of frequency..

Some of the Rogers RF laminates, Teflon, etc, have a dielectric constant that is CONSTANT (doesn't vary much with freq) and doesn't vary much due to the fabrication process.

This isn't to say that one can't design RF with FR4, it's just that one must know and understand how your material is going to behave (especially if you're doing distributed element stuff "striplines, microstrip, etc"). Kinda like Norm Abraham understanding the properties and behaviour of all the different kinds of woods that he uses in his construction projects! <grin>

> I am wondering if anyone can give me a ball park estimate of its dissipation
> factor (loss tangent) at 2.5 GHZ ?

No problem, its about 0.08 (PTFE is typically 0.002). for broadband circuits
and filters such as low pass elliptic, FR4 is perfectly fine.

I have used FR4 to replace a PTFE design in one of the companies RF products,
it is a frequency doubler covering output 1 to 2.5GHz with edge coupled
tracking filters and a 6th order elliptic low pass. The gain stages are
Stanford MMICs.

The losses of FR4 are historically overstated, as long as you allow for
dielectric constant variation and the loss tangent then you will be fine.

i.e. don't use it for super high Q narrow band filters/matchign circuits :)

Instead of PTFE one could also use ROGERS R4000 and similar laminates, they
require standard FR4 proccesses but have loss tangents of PTFE.

want any more info then mail me direct.

: http://www.btinternet.com/~g4fgq.regp

: ****************************

Yesterday, I hit the wrong key and deleted the followup I'd written
to the original question, but it said about the same thing. In
an air-core coil, the coupling is low enough that shorting out
the unused section just dings the Q a little. But putting that
shorted turn on a toroid with good coupling is indeed like having
a shorted secondary, and will very significantly alter the
inductance, I'm sure. Another thing to consider: by shorting
the unused part of an air-core variable (or switched-tapped)
inductor, you insure that you don't have big voltages floating
around. But in the toroid where you _probably_ want to avoid
shorting either one or many turns, you must live with whatever
voltage is induced in them. If your "variable" gets you down
to one turn active, with, say, 20 turns open, and you end up
with 200 volts applied to that one turn, then you'll get
something approaching 4kV across the other 20 turns. Beware!

I've found a lot of times I don't need really fine adjustment
of the inductance if I have continuously variable capacitance
available as well, and perhaps even just a 12-position rotary
switch (probably much easier to find) would do. Also, you
could have two inductors, each with switched taps, for "fine"
and "coarse" adjustment. But consider that inductance goes as
the square of the number of turns, so the taps probably should not
be a uniform "every third turn" all along the coil. Guess they'd
be more closely spaced toward the end of the coil if you wanted
more uniform delta-inductance per step. (But then on the other
hand you might _want_ it to be nonlinear anyway.)

Roy Lewallen (w7el@teleport.com) wrote:

: It looks like three values of Q might be getting into the discussion.
: One is the Q of the LR portion of the circuit*, with no C. I'm going
: to call it "LR Q"...

: Another is what I'd like to call the "component Q", ... which
: is Terman's definition, and can in theory be determined by a single
: measurement of the physical inductor.
[at a particular frequency, if Z = R + jX, "component Q" = X/R]

: So far, I've convinced myself that if you resonate the inductor with a
: capacitor, measure the bandwidth and center frequency of the resulting
: circuit, and calculate Q as the center frequency divided by the
: bandwidth, you get the "LR Q".

Yep, I agree with that.

: At least I know now what I'm measuring. A simple, direct, and reliable
: way to measure the "component Q", without separately determining the
: capacitive part, would be nice. A direct measurement using an
: impedance bridge doesn't work well for most of the inductors I'm
: interested in because of limited resolution in the range of interest.

Hmmm...the LRC meters we make seem to do just fine.

At least we seem to be at the heart of the answer to the original question now: the "component Q" does decrease with stray capacitance increase, but the "LR Q" (or if I may, the Q of a tank you build with the inductor) does not decrease with stray capacitance increase, so long as that stray is itself lossless.

I guess the bottom line for me is that the "component Q" expressed as a Q isn't very useful. The only way I'd really model the inductor (with its inherent capacitance and resistance) would be as R + jX at the frequency where I measured it, or perhaps as R + jwL' over some (narrow) range. Over a wider range I'd always use at least R, L and Cparasitic at least, and realize that I really need a frequency-dependent R to accurately model things.

:-) Guess I remain most comfortable with Q defined in terms of resonator bandwidth, or equivalently as losses inherent in a resonator, and "component Q" just doesn't seem that directly useful to me.

It's been an interesting discussion.

You forgot to mention me as one of the fools. I thought you said three? You only named two. Don't I count? Your hurting my feelings.

Tell us what you really think it's worth.

I can cut and paste too....

--

Wow!!! You still have that gem of an amp your trying to pawn off? I thought it would have been sold the first day you advertised it. Doesn't it make you want to scratch your ass in total bewilderment and wonder why no fool has taken you up on your attempt to sell scrap metal.
If you want us to take you seriously, please post with a price that you think would be fair for everyone. Look at it another way, would you honestly pay $600 for it. I think not.
Oh! Look! I haven't included your advertisement in my response. Ever wonder why? I'm too embarrassed to ask that much for a piece of crap and I won't advertise it for you. Wouldn't you be if you had any sense?
>If you tag your note on to this listing it
>will show everyone how low ham radio
>has to go to find the bottom._____
>and there you will be.
No, it just shows that some ham's aren't as stupid as you would like them to be. Haven't you ever wondered why your adds aren't taken seriously? Son, look in the mirror and you'll see the culprit, it sure and hell isn't use honest hard working hams that don't want to get screwed.

Many have noticed the countless posting of adds by KB5MER trying to sell his $600 six meter amp without any success. Several of us have responded to him in a professional manor with serious questions about his amp and were greeted with smart ass comments and the like. He feels it necessary to post constantly to the newsgroups thinking that some fool will purchase this amp from him. He should realize by now that it's counterproductive at this point to constantly harass the good reader's of these newsgroups since we feel that he has no intentions of ever selling his merchandise. If he would have responded to my questions in an adult manor he probably would be shipping this amp to me right now. But, we know now that his intentions are to spam the newsgroups and not sell his merchandise.

If he truly is the "good ham" that he claims he is he will respond to people's questions and comments in an adult fashion and post his adds in a manor that is not considered spamming. A good ham wouldn't post several hundred posts and harass all the people that respond to his adds.

He is also listed in the news.admin.abuse list if anyone cares.

Let me rephrase that. . . A simple, direct, and reliable way THAT I
CAN AFFORD. . :) Or something I can put together out of the limited
and somewhat antiquated test equipment I already have.

> accurately model things.
>
> :-) Guess I remain most comfortable with Q defined in terms of
> resonator bandwidth, or equivalently as losses inherent in a resonator,
> and "component Q" just doesn't seem that directly useful to me.

I agree that "component Q" by itself wouldn't be very useful. But it
might be easier in some cases to measure the "component Q" than the
component series R. (All I've gotta figure out is how. . .) Combined
with the relatively easy measurement of component series X, you could
use the "component Q" to get the component series R. But if you can
directly measure the component series R and component series X or L,
as you say there's not much need for the "component Q".

Thanks to all for your comments. I hadn't thought about this before --
it's been educational.

What an interesting idea! How about this: Get two capacitors of equal value but opposite temperature coefficients. Connect one end of each of these to point "A". Connect the other ends to the two ends of a differential variable capacitor. The "variable tempco capacitor" terminals are point "A" and the center of the differential capacitor. Whether or not it maintains a constant C would depend on how the sections of the differential capacitor vary with respect to each other, but it might be usable.

> Frank, KE4ZEQ

I read somewhere that one of the reasons for higher loss with FR4 is the
copper is etched in order to bond to the substrate. This increases the
surface roughness which increases losses due to skin effect. It also
contributes to waviness in the copper edges, also increasing losses due
to skin effect.

Supposedly, teflon substrates require a different bonding process which
gives a much smoother surface and edges, so it has lower losses.

The latest version of Puff is supposed to include surface roughness in
calculations of skin effect, but I have not had a chance to try it yet.

I have for sale a Boonton Model 42BD Microwatt meter with Model 41-4B sensor and cable. This instrument is in near perfect condition, last calibrated in 1995. Some of the specifications:

Frequency 200 kHz to 12 GHz (not sure of lower frequency limit)
Power range 10 nW to 10 mW full scale in six ranges
3 1/2 digit resolution

Although this meter has the switch for auto ranging and dBm display, these two functions are options and not present with this meter. This meter can be viewed at http://ro.com/~johnfarr/boonton.htm . I am asking $300 for it, buyer pays shipping. I am willing to trade for other quality test equipment.

Thanks
John D. Farr

For Sale:

Electronic Resources Co. (ERC) 1 Mhz Frequency Standard, model
EROS-800-ARA3

115 AC powered Solid state source 7.5" deep, 4 Inches Wide, 4.5 inches
tall. Output is 4 Volts P-P sine wave. OCXO with external buffer
amplifier and regulated DC power supply.

1 Short Term Stability 1 part 10E-9/ 1000 seconds
2 Drift 1 part in 10E-8 per week
3 Fine and course adjustments available on OCXO

Units are in like new condition. With full set of prints.

$75 post paid conus

Thanks for the read.

In the broadcast field, the VSWR of the transmitting system including
the transmission line and antenna is currently tested using an RF sweep
generator connected to a VSWR RF bridge or a directional coupler or
a power splitter. Since the signal to be measured is very weak, an
amplifier is usually connected between the measuring device and a diode
detector. Professional consultants who contract this type of measurement
will also use a Network Analyzer or a spectrum analyzer with a tracking
generator. Regards!

Hi Richard! I read with interest your article on synthesisers using
PLL's. I would like to share my experience on this subject. The most
difficult type of synthesizer to build is the octave bandwidth (example
500 to 1000 Mhz) In order to keep the phase noise and the phase detector
sideband supression over this bandwidth is not for the faint hearted

to use your expression. I spent hundreds of hours using design data from various manufacturers (10 inches thick) Since I was using a paralel (MC145151) I had to design the low pass integrator with a voltage of 28 volts to run the VCO over the full range. I never succeeded to get the phase noise and sideband supression below 70 DB
as measured on a spectrum analyzer at 10 Khz from the carrier. I then decided to design a charge pump using transistors; there is very little design literature on this subject and I had to work hard but finally it worked. The charge pump delivered 1 volt at 500 Mhz and 26 volts at 1000 Mhz and I met the 70 DB specification over the whole band. The filter consist of a capacitor plus a resistor/capacitor circuit for damping. The charge pump must be very well balanced in order to achieve these results. I have used this design at lower frequencies and narrower group of frequencies, it is rock stable. When the charge pump is well balanced, the filter capacitor value which had been calculated from a design equation can be varied by experimentation for best results at both ends of the band. Since my design used eproms and thumbwheel switches, the channel switching speed was not a problem in my application. Regards! Yvon

I'd be interested in seeing a schematic of your transistor-based charge pump design... do you have anything available? I've run across similar problems, trying to use low-noise opamps.

From the nickname i selected, one can tell i have something to do with the 8877. I would say this tube has made my ham radio activities a real pleasure. My second 8877 amp was in one of the magazines not long ago. In a new project, i would NOT select this tube any more. when i started to build my first 8877 the tube was $165 (1975) today it is more than $700, i think it is rediculus. Send me a personal, with your call and i will inondate you with info. 73 De WA1WLA and remember IT CAN KILL YOU.

just one question (hope it is not too silly). Is it possible to have
half turn tapping on a toroid coil, or will it count for one turn just
every time a turn passes the inner side, leaving little variation where
a turn is tapped on the outside?

Example: Is it the same difference between 2.2 and 2.8 turn taps on a
toroid core as for a high Q airwound coil?

Years ago a company named Oxley did make a adjustable cap called
terma-trim. This one (if I recall correctly) did cange the temp-co
whilst keeping the nominal cap value constant.

This would be a nice gadget when building free-running oscillators...
If I just could figure out how to build one of these trimmers easy....

Cheers
/Lasse

Hello Jan, nice to see you again.

I have thought about this for many years. But after much practical experience I have come to the conclusion there is no way of having fractional turns on a toroidal ring core.

When the turn-taps have to be wired up to a multi-contact rotary switch, if you observe the way in which the wires run between the taps and the switch contacts there can be only a whole numbers of turns.

Of course, if you want to cheat, you can drill a hole through the magnetic core material and obtain fractional turns in that dishonest method.

All the best for 1999, 2000, 2001, 2002, 2003, etc. . . . . .

Every time the wire passes through the centre of the core is one turn,
even if it doesn't actually wrap around it, so no, only complete turns
are possible.

There was an article a few years back where they cut about a quqter
out of the torrid. Then they rotated the core in and out a a self
supporting coil of wire..

ARRL pub I think..

I agree that the price for this tube is pretty steep. So, what would
your second choice be? In the interest of lower cost and not a "lot"
of sacrificed power, I'm now using a pair of 3-500's. I doubt the guy
on the other end can tell a difference (assuming you're running the
8877 at the legal limit and not at what it will really do...)
Kerry Miller, WD5ABC

PS Actually my last project went the other way, 4x 2n2222's!

You might like to think abouta Variometer. A coil with a smaller coil rotating inside it. As you rotate the inner coil you reduce and finally reverse some of the inductance of the big outer coil.

The windings are connected in series, of course.

This has been done. I thought it was in a piece of commercial equipment, and in an article in QST in 1964 or 65. I also thought it was in an edition of the ARRL Single Sideband manual.

However, checking the fifth edition of the book, I see a half-page bit (no author listed) on page 51 titled "Temperatur Compensation of Oscillators". It mentions that such a scheme is used in the Hallicrafters HT-32 transmitter. It does not give a value for the capacitors, but it mentions one of the fixed capacitors is an NP0 and the other an N1500

Checking the 1968 Handbook (because my QSTs are not in any sort of order to easily look up an article), there is a small bit about a 5MHz oscillator on page 285 that includes this scheme. It's from an article in QST for November 1965, page 29, which has to be the article I'm thinking of. It was a nice built like a battleship VFO intended for SSB use. It shows an NP0 and an N750 as the fixed capacitors, but doesn't say much about the scheme, so anyone curious might want to look up the original article.

I think the "Terma-Trim" was probably written up in QST around that time too. They used to run little pieces about interesting components, though I can't of the nifty term they used to feature them. It too might be findable in an index.

Yes, variometers are/were nice to use - even nice to look at.

BUT one big snag - Q

As inductance falls the loss resistance remains the same. Result -
when set to one tenth of max inductance the Q is only one tenth of
what it was at max inductance. In an antenna matching/tuning
application as much as half the transmitter power could be dissipated
in the variometer windings. Keep a bucket of water handy.

That's not bad when you consider 25 years of inflation. It's still not
bad in terms of dollars per watt - a (U.S.) legal-limit amplifier
remains a major piece of equipment, with a price tag (and
electricity bills) to match.

What would you use in a new design? One of Svetlana's products? An army
of power MOSFETs?

A couple of things about this....

Besides this being illegal (jamming a radio common carrier even on your own property is a no-no, but I'll let you and the cellular carriers legal dept handle that one!), you'll need to do some homework to build an effective jamming system that would prevent ANY and ALL potential guests to your home from gettting calls, (I assume you don't want any beepers going off either).

First borrow or rent a good lab grade spectrum analyzer so you can make signal level measurements of ALL paging and cellular carriers at your location (uh...on second throught just buy one instead of renting since you'll need to do this often as more cell sites get built, new service providers come on line, etc...) Once of determined all the frequencies that need to be jammed (you don't want to do broadband white noise as this would interfere with the listening of Christmas music on the radio or watching an off the air ball game or "It's a Wonderful Life").

Now you can start designing a frequency agile jamming system. You'll likely need to develop something that can deal with wideband carriers such as CDMA which are very resistant to jamming.

You'll likely be so busy with this project that you won't even have time to sit and eat any Christmas dinner so whether you ever get it working or not, may not even matter! You know what they say it's the journey, not the destination...

244. WTD: Some misc parts for 40 meter transmitter.

Greetings,

I am building a 7Mhz transmitter from scratch. Uses a 4-65 for the final, at about 200W input. I am collecting parts but having a problem finding a few. These used to be common junkbox items when I was doing this stuff in the late 50's, but times have changed. I know I can buy all this stuff (at high prices) various places, but I am on a tight budget. Have other antique electronic stuff to trade, or will buy used if the price is reasonable. Looking for:

Ceramic socket for 4-65 (odd 5 pin, same as used for 829B)
Ceramic plate cap for 4-65, and plate caps for pair of 866A rectifiers
Plate RF choke (about 1Mh? 1500VDC on this, passes about 200Ma max.)
Plate coupling capacitor (1000pf or so, value not real critical but must be 3000V)

That's it, I've scrounged most of the other stuff. Thanks

Doug Moore KB9TMY (Formerly K6HWY)

Bill, you might want to offer the TUF-3 as an option for Lowfers and
cavers, and those lucky Europeans with 136 kHz allocations. It will
go down there, the TUF-1 won't. I helped a caver friend modify a
mini-R2 for cave radio. We used the TUF-3.

> immediately rules out testing antennas.

Jim-

I think the original premise was that an SWR Bridge was on order, and an alternate method was needed. Now, we have gone so far as to design a TDR, only to realize that it gives results that are only meaningful for a resistive load.

Since we have taken this approach, let's go a step further. Lets build the reflectometer portion of of the bridge in order to derive a voltage related to reflected power, which will be fed to the oscilloscope's vertical input. Now, let's take the oscilloscope's horizontal timebase "ramp" and drive a VCO that will cover the frequency range of interest. Using an open circuit on the Co-Ax, adjust the vertical axis of the oscilloscope for full scale. Using a good 50 Ohm load, verify that the reflectometer output is zero. If the horizontal axis can be calibrated for frequency, then we now have an "FDR"!

Can anyone confirm that? The point is that if one wanted to make a very
high-Q coil from thick copper wire or tube, would it be a good thing to
polish it?

There is an IC called LM3909 (I think 'LM' but definitely '3909') that
is specifically for flashing an LED. The frequency of the flash is
determined by a capacitor on two of the IC pins. You could search around
for a data sheet of this IC.

: >make-before-break contacts.

: just one question (hope it is not too silly). Is it possible to have
: half turn tapping on a toroid coil, or will it count for one turn just
: every time a turn passes the inner side, leaving little variation where
: a turn is tapped on the outside?

: Example: Is it the same difference between 2.2 and 2.8 turn taps on a
: toroid core as for a high Q airwound coil?

If the toroid core has high permeability, it's really not possible to
get fractional turns. You either have a full turn, or you don't. You
can think about drilling holes through the core to intercept a fraction
of the flux, but then you have to think about how current in the wire
that passes through the hole will affect the distribution of flux!
(I can't imagine doing this as anything but a "thought-experiment"
.. Well, I can imagine it, but won't be doing it myself!)

If the core is very low permeability...and the Amidon #2 and #6 cores
probably qualify...then you can get _some_ partial-turn effects. But
I think it's not worth the effort. We should probably combine these
thoughts with the discussion a while ago about how spacing of turns
around a low permeability core DOES affect the inductance some.

: Inherrent good quality silver micas are about +40 to +100 ppm/deg c but
: for low values the fringing field means that the dylectric of the
: potting material comes in and give a worse tc and loss angle.
: NPO ceramic are specified as +-30ppm/deg/c and are doped for minimum tc.
: there are also porcelain npo that have lower loss at UHF chip caps
: because of their absence of potting could be better though low values
: will include board Tc as part of their overall performance.
: Polystyrene are also good if unencapsulated but vulmerable to solder
: damage.

Thanks for the summary, Doug! -- There's a graph in "Reference Data for Engineers" that shows mica to have a very linear variation with temperature, positive as you note. The same graph shows polystyrene as also very linear, about five times the coefficient, and negative instead of positive. Polypropylene shows as just slightly worse than polystyrene, and also very linear. Polycarbonate is positive, just slightly worse than mica, but nonlinear if it gets cold (below ~0C). Both polyester (Mylar) and oiled paper are nonlinear and have very high tempcos at most temperatures.

I'm reminded of a low-value capacitor that HP made for a very special application which went to some extremes to get stability. It seems that the capacitance of an air-dielectric capacitor will change because of changes in humidity and atmospheric pressure. So...these were sealed in glass, I believe evacuated, and spaced with ruby balls. They were roughly 3pF. Obviously that technology lent itself to being replaced by something a little less expensive. One of the fellows did some work on metalizing fused quartz "microscope slides", and by use of a guard ring could get very stable capacitance with very little effect from the air, because almost all the dielectric was fused quartz.

Hey, in my junque box, I have such a thing, I think made by Beckman.
Its nameplate says it's a variable delay line. Construction is
similar to a 10-turn pot, but the wire is copper and is wound on a
mandrel which is non-conductive and put into a helical groove to get
the capacitance. Seems like it's about 25 turns instead of 10, but
I don't remember. (It was used to trim the total delay in a system
where the main delay came from a large hunk of quartz with a
polygon perimeter...)

Absolutely true! At HP we used to require plating with a surface that
would be mirrored finish in order to increase the Q of the resonant
structures. Actually, plating with silver gave the best effect.

> Kerry Miller, WD5ABC

One ought to understand the 3db change for every doubling of the output power
before he turns his amplifier ON. I once had an argument with a MM operator
who told me that I was runing ilegal power. I explained that my 8877 does
not go to ilegal power levels, and someone who spend a lot of time buildind
an amplifier, knows that between 1500 watt legal and 2200 that this tube can
put out there is litle or no diference on the receiving side and i ought to
be naive to abuse an expensive tube with out any gain. I selected the 8877
because of the small sise, my #2 amp is only 3 1/4 inches high. If I was to
try once again I would probably go with " a pull" 4cx1000. They are easy to
find and the power output, acording, the dubling of power =3 DB, makes this
tube a better choise. So either you use a 4cx1000 that will give you close to
legal power, or get a 3cx3000 and be cock on the rock. More of us (me too)
ought to study the efects good antennas tend to have to the signal strength
Having said that I will ad that to a ragchew qso an 8877 driven for 800 to
1000 watt output puts out a clean (very clean) signal that the receiving side
enjoys. 73 De WA1WLA and remember IT CAN KILL YOU

of our signals.

<SNIP (stuff about jamming cell/pagers & the legality thereof...)>

Aw heck, it's a whole lot simpler than what people are suggesting, and, perfectly legal as far as I know. Instead of jamming, try shielding! Just make your house into one big faraday cage and, shazam! No more annoying cell phones and pagers going off!

It'll take a few boxes of aluminum foil (use copper foil for really good connections, and solder the seams), but what the heck, is that such a high price to pay for some peace & quiet? And if CC&R's are a problem, you can be crafty and do all the shielding on the inside so nobody will ever notice! Doors and windows could be a problem, but if you could probably get by with copper screen. That's fairly effective at 800MHz. Of course, if you just cover them with foil, you get the added feature of far improved privacy as well! And, with this method, those super secret gov'mint snoops won't be able to tune in on what you're doing either!

It would be a good thing to polish it and then silver plate
it. The plating doesn't need to be much thicker than the skin depth
at the frequency of interest.

This mod adds a much finer tuning resolution for the slow setting on sideband. I can pretty much zero beat every signal. You will lose the tuning range, but will gain a finer resolution. If you want range, just switch to the fast setting. Attach a 4.5K resistor across the left/bottom and the right solder posts on SVR5. SVR5 is the 480 Hz tuning for the sideband. Maybe somebody can describe where it's located for those who don't have a schematic.

The mod does not work for all side band operation. If a signal is not relativily centered or too far, requiring a lot of tuning, it's impossible to tune it in because it isn'tcontinuous. You can tune up to a point either way and then it drops off. Anybody have any suggestions on how to make the tuning mod work so that it is continuous ? It works fine for SW,MW and SSB that's relatively centered.

Hi All;
I have for sale a Ten Tec model 244 digital display for the triton IV xcvr's.
It came from an estate and all I have is the unit and the Manual.
The previous owner has added a two position switch on the left front panel for
watever reason, otherwise its in real nice shape! The unit is
untested and being sold for $100 ppd Conus.
I have a picture of it at my FTP sit if you wanna see it!

Rogers Corporation
http://www.rogers-corp.com/mwu/index.html
offer a free downloadable calculator for microstrip.
Their site is not responding at the moment, so I can't give you the exact
URL, you will have to hunt for it. The calculator has an entry to specify
surface roughness. But this
seems to have a minor effect on attenuation and Q.

John, your post has not reached this server yet, but if I understand your reply, apparently you received a copy of my post by email.

If so, I apologize, and did not do it on purpose. The reply buttons on Netscape for "Mail", "News" and "Both" are very close together, and I may have accidentally hit the wrong one. Sorry.

I didn't do it, and I'll never do it again!

Best Regards,

Michael R. Monett,

From: Jim <electinn@flash.net>
Message-ID: <36945AA0.71D7@flash.net>
Source record: 75033

Also check the following two companies for many types of
batteries to rebuild most any battery pack. Also request a
free catalog of their replacement battery packs for many types
of H.T.'s, Laptop Computers, Camcorders, Cell Fones, ect.:

Battery-Tech, Inc.
Ph. (800) 442-4275
Fax (718) 631-5117

and

Mr. NiCd - E.H. Yost & Company
Ph. # (608) 643-3194
Fax # (608) 643-4439

They also have some "Battery Eliminators" for some equipment
using basically an empty battery pack with a "Wall Wart" (Xformer)
attached so you can eliminate the batteries all together !!

Good Luck, Jim - N5APG

Yes, slug-tuning is possible as in receivers. The only advantage would be a reduction in size. But when appreciable amounts of power are involved, magnetic core materials are too lossy. The greater power dissipation combined with smaller size results in over-heating.

As an extreme example, the result of using a small ferrite rod antenna with only two watts of transmitter power would be smoke.

Source record: 75036

I have a small quantity of NEW circulators for the VHF/UHF bands between 68 and 600MHz. Each unit has a nominal octave bandwidth.

Power ratings are between 25 and 50 watts depending on the exact model.

These are non-connectorised units and will require a couple of trimmers to match to 50 ohms

Anyone interested - please phone Dave on +44 1276 686889 during office hours

Looking for a large slide-rule dial mechanism, Eddystone,
James Millen, or similar, like those used in many ARRL
Handbook receiver projects back in the '60s and '70s.
Must be in decent condition, complete, and working. If
used, must be able to replace dial scale. Whatcha got?

Are there any webpages that take you step by step how a vhf
transmitter works and what each part of the transmitters circuits do.
Most of what I have seen so far just shows one part of the transmitter
dose and dosen't explane how it is connected to the rest of the
transmitter or shows a full transmitter with little or no explanation.
I have been into building electronics for a few years but I still
can't figure out how transmitters work, well except for the very
simple ones.

Hi, All!!

I like to tear pages out of magazines, whenever I see anything that catches my eye. This saves a lot of hassles with the XYL complaining about the size of the piles in the shack!!

Anyway, one of the 'pull outs' I have talks about a voltage controlled inductor. I am at work now, so can't look it up and will have to describe it from memory. Another thread on homebrew roller inductors made me remember it

As I recall the design used two toroid forms with three windings. Two of the windings were wound seperately on two of the forms, with opposite 'sense' (that is mirror images of each other). The two coils were then stacked and the third winding wound over both.

If I remember correctly the third winding was the control winding on which direct current was applied.

Has anyone out there ever used such a thing? Would it be usefull at RF, or would there be too much coupling into the control winding?

Jim

Has anyone out there ever heard of Jan Crystal, and if so, are they still in business? I need a 69.5 MHz sinusoidal crystal oscillator (or at the very least, a 69.5 MHz crystal) and I heard that this company does this. I would appreciate any contact information, and if anyone out there can recommend a good company or three that makes crystals/crystal oscillators at 69.5 MHz, I would really appreciate it. Please follow up with an e-mail at: jdhaas@mtu.edu (preferred) or post it here.

288. Help: Geo-stationary satellite Antenna

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-07 00:00:00 UTC
From: Steve Robbins <s.robbins@XXXbtinternet.com>
Message-ID: <7737kb$7e1$1@mendelevium.btinternet.com>
Source record: 75047
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew,uk.radio.amateur

Does anyone know how to construct an antenna for reception of geo-stationary satellites.
The downlinks are 1.7Ghz. I have tried a simple dipole at the centre of a 1m dish with a pre-amp, but this doesn't seem to have enough gain.

I have been told that you can make a waveguide out of a coffee tin for better gain but I don't know any dimensions to begin.

Sorry if this is a bit off-topic for these groups, if anyone has a better newsgroup suggestion please could you let me know.

Any ideas for a higher gain antenna (bigger dish not an option unfortunately), web links etc appreciated.

Thanks.

I have had a couple of replies to this directly to me instead of the group.

Evidently there really are such things and they can be used at RF, although I would think that you would have to be careful with the mechanical design, as with all RF circuits, to use it at the higher frequencies.

One of the replies said that you need only one core, and wind the RF and DC parts on opposite sides of it.

The article I mentioned in my original post suggested using two stacked cores to get the best performance and, after pondering it for a while, I recall that it said that using two stacked cores will minimize the coupling of RF into the DC winding. Remember that the two RF windings are in opposite directions, hence will not couple (theoretically) to each other. This would be an advantage at higher frequencies I beleive. It would also keep the DC winding from looking like a shorted turn at some frequencies.

This idea intrigues me. I can think of a number of interesting uses, such as automatic antenna matching, DC control of amplifier tanks, and voltage controlled oscillators to name a few.

What properties would such a thing have? Would the inductance be linear with respect to control current? If so, it would have an advantage over capacitance diodes.

Tom Bruhns pointed out by email that the temperature coefficients I posted earlier were backward. The polystyrene capacitors have a negative temperature coefficient, and good inductors a positive one. I was thinking in terms of the direction of VFO frequency drift, which is of course opposite the direction of L or C value. Thanks, Tom!

The only kind of "voltage-controlled inductor" I know of is one that uses a saturating core. An additional winding on the core, with DC passing through it, causes the core to saturate, reducing the permeability and therefore the inductance. I would imagine that the DC winding could be isolated with an RF choke or resistor.

This scheme should work with a high-frequency (type 60 series) ferrite core, but you'd have to be careful to make the level of RF much lower than the DC bias to reduce distortion. Even at that, I'd worry about harmonic generation because you'd be operating on a nonlinear part of the core's BH curve. Cores with a gentle saturation characteristic (round as opposed to square BH curve) should be more controllable and have less distortion. I'd think that using a gapped core would make the saturation characteristic more gentle, but then it would require a lot more DC bias to saturate it. In any case, I wouldn't one until I thoroughly checked out the resulting harmonic content. I've thought about doing this for a portable QRP tuner from time to time, but think it would be tough to keep the power requirement reasonable for this application.

Hello--
There are (or were) commercial components called "Increductors", which
used a control current to vary inductance-- these saw application as
the swept RF oscillator tank circuits in Kay Instruments' line of RF
sweep generators of the 1950s-1960s.

You could easily build a voltage-to-current convertor to drive one of
these--Kay used a circuit based on a 6V6 tube. Dunno where you'd
find an Increductor, short of savaging an old sweep gen, but there are
probably hundreds sitting on the back shelves of better surplus shops
across the U.S.A.<g>.

A literature search in old IEEE/IRE Proceedings or Transactions might
yield design details.

It's funny that you use ammonia and say it doesn't remove copper. I use an ammonia-based bore cleaner on my firearms and it most assuredly dissolves the copper in the gilding metal (a copper alloy) left in the bore. In fact, I wet-swab the bore and let it stand for a while and then use a dry patch. The dry patch comes out green from the copper salts formed by the ammonia. I would get a cleaner specifically for use on electrical contacts. The black is possibly from a beryllium salt, although I'm not sure.

Hi Folks,

Many years ago when studying the use of magnetic amps used in TWT regulated supplies I picked up a reference in the bibs that spoke to an all mag amp receiver RF/IF amplifier experiment. You might dig around in some of the university dust bins for a diss or thesis on the subject. While not that efficient, mag amps in the 60 Hz and 400 Hz range are fairly cute systems and can handle a lot of power.

Just a thought

73,

Bob, KE6f

Steve,

I've found that CAIG Laboratories, Powy, CA.
(619) 486-8388 Http://www.caig.com/sb-ae.htm
makes items for doing that and far more. They
make a "liquid" called Cramolin which comes in
two colors. red and blue. Made for NASA, it is
used as follows: First apply a thin coating of
the red color which will clean corrosion off
of anything. After applied (nail polish brush
or Q-Tip) let stand for several minutes, and
then wipe off (Q-Tip) vigorously. Once this is
done, apply the blue liquid in a very very thin
coating. This will protect from further cor-
rosion and it seems that it makes all connc-
tions have negative resistance at the point of
contact. You can do this to one of the channels
of a hi-fi systsem (tuner->preamp->amp->speakers)
and anyone who is not deaf can hear the major
difference in the fidelety of the "treated"
channel.

In building sattelites, this stuff was man-
datory on every electrical/rf coupling. It
is really magic stuff. In years past, this
stuff was so secret that it went for $100
a gram and was all stolen from gov't. labs.
Caig was finally allowed to go public with
it, but for years the only way you could
get some was to go the the Consumer Elec-
tronic Show in January in Las Vegas, go to
the "Monster Cable" booth, and whisper in
the salesmans ear and slip him a $20 bill.
He would then go into the back of the booth
and come back and slip a couple of 1/5 Oz.
bottles, with instructions, in a tiny zip-
lock bag into your pocket. (Nothing was
allowed to be sold at the CES). There was
no hint on the label as to who made it or

where, but "Cramolin" was printed on the bottles. Having a set of these two bottles in your lab/tool kit/desk was the "secret sign" that you were one of the "in-crowd" in astrophysics/engineeering. A set of these will last you about 5 years, if used judiciously, it doesn't take much.

They don't look like a SB-200. SB-200 has 1 amp meter (1000ma actually)
the grid is the left half in white. There is also a HV scale and and
SWR scale. The milliamperage looks too low to be on either amp. The
SB-220 is quite a bit heftier than an SB-200 (I have a 200, have not
seen a 220 recently.

I have a small quantity of precision ground 8mm +/- 0.01mm diameter INVAR for sale.

INVAR is a Nickel-Iron Alloy with a very low temperature co-efficient.

Typical use:- A thermally stable tuning element for hi-Q cavity filters.

Anyone interested please phone Dave at + 44 1276 686889

PS Aluminium Beer Barrels make EXCELLENT filters for 2 metres.

PPS Make sure that the Barrel is empty before starting the project. Contents should be disposed of thoughtfully - the time honoured method is still preferred - although in these environmentally conscious times, care is required to avoid excessive green-house gas generation.

Also avoid peanuts - this can result in excessive pebble-dashing of the fixtures. Although this does not affect the cavity in any way - it sure hacks off the XYL!

PPPS Rumours that weak signals are the result of using kegs which contained low SG beers has not been substantiated under controlled tests. However, Real Ale is always prefered. However, traditional wooden barrels are regrettably not suited for cavity construction.

PPPPS 6 metre cavities require very large beer kegs - about 6 feet in height. Full kegs will almost invariably require the assistance of fellow amateurs to dispose of the contents. Consideration should be given to asking Dyno-Rod to be on standby and have a supply of asprins to hand.

PPPPPS Cavities are also excellent at dealing with SPAM - so beloved of a minority of Internet users.

Simply open the cavity, place a slab of dielectric material (PTFE or Teflon preferred) at the bottom of the cavity, place the SPAM on the slab, along with eggs, bacon, mushrooms etc, reassemble the cavity, apply power and adjust tuning to compensate for the capacitance of the SPAM, and - voila - the SPAM becomes Breakfast.

Cooking time depends upon power levels. It is rumoured that certain stations in Eastern England can cook a full meal in less than 10 seconds.

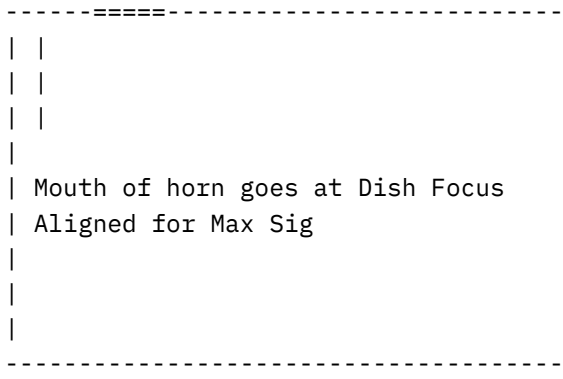
Hi Steve

Simply placing a dipole at the focus of a dish will not give a very good
signal. You need to place a reflector behind it so that focused FR
energy hits the dipole correctly.

You can make a coffee tin feed and these are very easy.

For 1700 MHz a baby milk can would be suitable and an N type socket is
then mounted on the wall of the can like so



Dimensions are roughly 180mm dia 430mm long with the probe located 110mm
from the back.

the probe in the tin should be 45mm long

hope thats a start!

>One of the
>fellows did some work on metalizing fused quartz "microscope slides",
>and by use of a guard ring could get very stable capacitance with
>very little effect from the air, because almost all the dielectric was
>fused quartz.
Thanks Tom
The fused "silica" is interesting because chemically it will be similar
to crystalline quartz and a parallel electroded plate cap is what a
crystal shunt capacitance is! if you stay away from resonances a
standard crystal could be used as a capacitor.
The other relevant characteristics are loss and dilectric adsorbtion
more of a problem with plastics.
Note from my background with precision crystal oscillators I remember a
propriatry green glass piston trimmer that was specially doped to give
NPO that had dramatic increases in loss angle at certain temperatures
took me months to trace the problem apparently the curie temperature of
the dopant came into it; the lesson is good Tc does not always go with
stability etc..

There's no way that you could fit the 3909, a LED and the huge capacitor
that has to be used inside of a standard plastic LED case.

He's looking for the LED that has a built-in flasher.

Yes this is good stuff. We had a switch failing on a 20 channel recorder and nobody wanted to replace the switch. We were able to extend the life of the switch by 2 years by using Cramolin. At this time the whole recorder was replaced with a digital one. It also kept circuit cards working that had all the gold wore off of them until new equipment was installed.

One interesting application in which the "true" inductance is important is in the elliptic low pass or bandpass filter,
where a parallel L and C provide a "zero" of transmission at some frequency. It is important that the L be the true L
and that the C include the stray Cs of the coil (assumed to be a lumped Cs value). If we don't do this, the filter is
not as correctly constructed as it should be.

Source record: 74982

In the early 1940's, perhaps in the late 1930's, The Cossor Radio Company, UK, produced an oscilloscope plus an attachment for the purpose of aligning radio receiver IF transformers. It was called a 'wobbulator'. It displayed the frequency response of 465 kHz IF amplifiers versus a swept frequency. I believe it was first used in the production line at Cossor's radio factory.

The IF signal generator was a Hartley oscillator frequency modulated at 50 Hz (the power supply freq.) The oscillator coil was wound (I think) on a dust-iron rod about 1/2" square. This rod replaced the I lamination in an ondinary I and U, small, laminated, iron-core power transformer. The CRT horizontal (time-base) deflector plates were supplied at 50 Hz from the equipment's HT supply transformer secondary winding.

A winding on the laminated part of the oscillator coil was fed with DC superimposed on 50 Hz AC. The DC was used to set the IF centre frequency. The magnitude of the superimposed 50 Hz AC was used to set the frequency sweep width.

The frequency sweep width was small enough not to result in non-linearity.

By the 1950's such 'clever' instruments had been replaced by even more clever devices - reactance modulators using valves (tubes) and the Miller effect. Now all we have is a pair of back-to-back diodes.

As an example, it starts out with a crystal oscillator, say at 1 MHz. This is fed into a comb generator, which will generate lots of harmonics at 1 MHz spacings and is then filtered with a 30 MHz low pass filter. There is also a VFO. For this example lets say it runs from 70 to 100 MHz. Lets say there is also a narrow filter at 70 MHz. [It is called 'comb generator' because it looks like the teeth of a comb when you look at it with a spectrum analyzer.]

The VFO is mixed with the comb generator and fed to the 70 MHz filter, which filters out all but one of the harmonics. The output of the 70 MHz filter is then mixed again with the same VFO signal to bring it back down to the original frequency (with another 30 MHz low pass filter).

The result is, allegedly, a nice clean signal that can be switched in 1 MHz steps by tuning the VFO.

It sounds neat, but there must be some catch or it would be used more often. I can think of a couple of possible problems. One is that the 70 MHz filter, in my example, would have to be pretty darn good to eliminate the unwanted parts of the comb signal. The second is that any crud on the VFO signal will show up on the output, destroying the nice clean crystal purity.

Don't give up hope yet. I think that it still has some use for the homebrewer if you are aware of the potenial problems.

One problem with this is that TV is very wideband. If you can retune
them, you'll find that there isn't much that is so wide, so you'll get a
large number of signals in the passband. Not too useful.

In addition, TV signals in North America are AM, and there wouldn't be
much to hear apart from the bandwidth problem. The audio is FM, but it's
a subcarrier to the video signal. Without the video signal, any FM signal
in the passband will not reach the FM detector (note: I've seen some
schemes to reduce the buzz you get when there's a lot of white in the
picture, and some of them might not need the video signal for the audio
detector to work, but these schems aren't common and I would think
unlikely to appear in a TV card). Even if there was no problem with the
FM detector, it's bandwidth is still fairly wide compared to two-way
signals commonly found in the VHF/UHF spectrum.

Someone once posted a long and interesting article about using an FM
tuner card for extended use, I think to this newsgroup. Sadly I can't
remember any of the details of the contents or the headers. Doing some
searching at http://www.dejanews.com might turn something up, if you can
figure out the proper keywords.

He never addressed the issue of the tuner's widebandwidth compared to most
two-way FM signals, however.

This is a cool idea.

Can you describe the operating principle of a comb generator? I've always been curious about this
but haven't seen an explanation anywhere. Perhaps it's that the harmonics all have an equal amount of power in them, as opposed to falling off as in a multiplier?

OK, I'm curious now. Anyone have a circuit for a comb generator online?

Take a look at my article on an iambic keyer with the Basic Stamp I in the July/August 1998 QEX. Hard to do sidetone and iambic keying without interrupts but it is possible. The article has the PCB layout and all the details.

Regards,

Al Williams

Thanks for the input. I have a couple of magazine articles on using a TV tuner for a VHF/UHF receiver and already had assumed that narrow-band filtering would be the least of my problems.

You realize that there are many TV-band radios that receive TV audio without the video.

My biggest problem is that I have not been able to uncover schematics or programming guidance for these TV cards. With these, at least I could blindly experiment! Since these cards are selling for as little as $29 now, I imagine many older ones will start showing up at fests, computer shows and thrift shops for a dollar or so. Scotty

I haven't got a baby Jim, but I will quite happily donate it's contents to a neighbours baby if it gives me good reception (the can, not the baby).
Thanks for the suggestion Simon, I will give it a try.

Buy the milk for the can and throw the contents?

Oh yes - as someone rightly pointed out - the probe needs to be aligned
for the correct polarisation.

Horizontal polarisation needs the probe to be horizontal and vertical
needs it to be vertical.

Does not matter whether the probe is at the top/bottom - left or right
side as long as its orientation matches your required polarisation.

Good luck!

Unless that satellite has a rather energetic downlink, a one meter dish at that frequency won't do a whole lot . . . But, perhaps, it does have a hot signal on the ground. You didn't say . . .

This newsgroup is for radio homebrewers. Have a look at
Harry's Homebrew Homepage. There is a link to it on my
web page (see sig, below.)
You will find information about both kinds of home brew.

The best wine recipe book I have seen is:
First Steps in Winemaking by C.J.J. Berry.

I wonder how many radio homebrewers have an interest
in winemaking/beer brewing?.

336. T & Pi Matching and Phase-shifting Network design

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-08 00:00:00 UTC
From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <01be3ba3$3f520340$ee5fac3e@default>
Source record: 74999

ROLL-UP, ROLL-UP, ROLL-UP, ROLL-UP, ROLL-UP

ALL YOU HOME-BREWERS, GATHER ROUND -

AN ANNOUNCEMENT

A brand new, original piece of design software for T and pi impedance-transforming networks having either leading or lagging specifiable phase shifts.

==========
============ Program TPINET.exe =============
==========

Applications: PA pi-tank output circuits, amplifier interstage coupling, phasing networks for beam antenna elements, artificial delay lines, etc.

Input data: frequency, input ohms, terminating ohms, phase shift degrees, coil Q.

Output data: L and C component values, operating Q and bandwidth, loss as percentage of input power and in dBs.

Available by downloading from my website at the usual, genuine give-away price.

****
Reg, G4FGQ CLICK URL BELOW
http://www.btinternet.com/~g4fgq.regp

****

PS. I would be interested to hear of suggestions about additional input data and additional output data. The design of coils, number of turns of what gauge wire etc., is covered by program SOLENOID.exe

I don't know why no one mentioned using your original circuit, (with
the chatter problem), to switch a pin diode bridge instead of a relay
and simply go QSK!

anyone out there using the radio control freqs in 6m?
i want to convert my gas r/c car over to 6m and get out of
the 'too close to cb band' the radio equip is on now.

every time a cb'er calls his/her spouse, the base on the other end
sends my car careening into a ditch at 50+ mph.
[a little exageration on the ditch maybe, most times it circles wide
open close to top speed from a cranked servo, but it is a pain]

finally got the engine tuned nice and spent xtra $$ on the 2 speed
tranny but 3 to 4 minutes of uninterupted play is it.

any sites on r/c gear for the ham 6m band would be appreciated.
i've a ton of info, just not r/c gear for the ham band.

thanks

For Sale:

Collins 70K9 PTO. Solid State PTO tuning 2.5 - 3.5 Mhz. Provisions
for oven stabilizer and electronic trimming or phase locking. With all
documents, tested. 3 1/4"W by 3 1/4 deep by 1 1/2 inches high. Has ten
turn over crank protection cog system and an oldham style shaft coupler.
Removed from Collins 618T avionics gear.

$50 post paid conus

Tnx for the read

They may still make it for NASA and special customers, but you're not likely to find it on the shelves any more. They have an alternate formula called DeOxit that I've found to be quite good for contacts. It appears expensive until you start using it; I've had a 25 ml bottle for 3-1/2 years now and I've been putting it on virtually every contact I touch. (About 10 ml left.)

It smells very much like Tinkertoys. I haven't found anything that it harms yet (but it's too expensive to taste-test :-).

Caig no longer sells Cramolin. Their replacment products are Deoxit
and Renuzit (spelling?).

From a posting last spring back in one of the newsgroups, Cramolin
is a product of a german company of that name and they were seriously
pissed off that 1) Caig claimed to be the manufacturer, and 2) that
Caig was claiming that they could no longer sell it because of the ban
on chlorofluorocarbons. It's still available, somewhere.

Jim (jbolinger@lintek.com) wrote:

: I have had a couple of replies to this directly to me instead of the group.

: Evidently there really are such things and they can be used at RF, although
: I would think that you would have to be careful with the mechanical design,
: as with all RF circuits, to use it at the higher frequencies.

: One of the replies said that you need only one core, and wind the RF and DC
: parts on opposite sides of it.

Nooooo...that won't work well at all. You can use one core, with the RF winding wound in the "usual" toroid way, and the DC winding never passing through the center, only over the outside. -- If you do it with a ferrite core, saturation occurs fairly suddenly; powdered iron cores would saturate rather slowly and at high ampere-turns, I believe.

: The article I mentioned in my original post suggested using two stacked
: cores to get the best performance and, after pondering it for a while, I
: recall that it said that using two stacked cores will minimize the coupling
: of RF into the DC winding. Remember that the two RF windings are in
: opposite directions, hence will not couple (theoretically) to each other.
: This would be an advantage at higher frequencies I beleive. It would also
: keep the DC winding from looking like a shorted turn at some frequencies.

Yeah, I'd wanna make sure the two cores (with windings) were pretty well matched. You want to have flux in opposite directions in the two cores. You can also, I think, swap the windings and use the single one for the RF and the other two for the DC.

: This idea intrigues me. I can think of a number of interesting uses, such
: as automatic antenna matching, DC control of amplifier tanks, and voltage
: controlled oscillators to name a few.

Some might work OK, but you may be disappointed by the nonlinearity of the inductor in any but low power applications. At high power, you're likely to generate lots of harmonics, since the RF flux will add to the DC and take one core or the other deeper into saturation, and the other not so far.

: What properties would such a thing have? Would the inductance be linear
: with respect to control current?

I'd expect for ferrite cores, the inductance change would be rather abrupt, for small RF signals.

Date: 1999-01-08 00:00:00 UTC
From: Stephen Schiller <polytope@prado.com>
Message-ID: <773pm5$ea1$0@209.66.82.22>
Source record: 75065

I am wondering what others have found useful
and effective in cleaning APC7 and GR900
connectors. Over the years I have collected
a number of surplus items requiring such cleaning.
I generally resort to using concentrated
ammonia for cleaning copper as it disolves
grease and copper oxide but not copper itself.
It also has the advantage of leaving no residue
upon evaporation.

However, the beryllium copper alloy used in
GR 900 connectors seem to often have a black
tarnish that is not easy to remove by this
or other means I have tried.

So, what works for you???
Has anybody any opinions on polishishing the metal,
or using an abrasive cleaner such as Bon Ami?

thanks,
Steve

mervins@aol.com (MervinS) writes:
>You realize that there are many TV-band radios that receive TV audio without
>the video.

A TV transmitter actually has two separate transmitters with carriers
4.5 MHz apart - one big AM transmitter with lots of bandwidth for the
video, and a lower-power FM transmitter for audio. The signals are
independent, and you can receive them independently with two separate
receivers, or receive the audio alone.

But many tuners designed specifically for TV have a single local oscillator
and a single IF that is used for both video and audio. The two signals
are split later in the receiver. In some designs, the video signal needs
to be present to extract the audio.

So a communications receiver intended for audio can receive TV sound
as long as it is prepared to deal with the relatively wide deviation
(25 kHz). But a receiver designed as a TV tuner may not be able to
receive FM voice audio if there is no video carrier 4.5 MHz away.

Re: Wadley Loop

Hi,

This was of course the basis of the famous Racal RA17 receiver that was made in England and sold in its tens of thousands in the 60/70s (a large number went to or were made in Canada I seem to remember). There was a version with U.S. equivalent tubes/valves and with a meter calibrated in S-points for use by the well-heeled ham.

Anyone who has seen one of these sets will know that it used a very substantial diecast chassis with lots of compartments to keep potential spurs at bay. Legend has it that Racal nearly gave up on it until someone thought of hacksawing through selected parts of the chassis to isolate and ultimately eliminate the problem.

Wadley-Barlow (or was it Barlow-Wadley) was a South African company if I remember correctly, as I think was Wadley himself. One of his most striking inventions was the microwave Tellurometer which could measure distance to a fraction of a metre over several kilometres.

I believe the National HRO500 employes the same scheme as RA-17,
Barlow-Wadley, and the FRG-7. If I recall, one selling point
for the BW and the FRG7 was that by using the same osc any
drift cancels in the two conversions and a mess of crystal references
could be eliminated.

The 1994 ARRL Handbook mentions aircraft, vehicles, and sailboats, and
cautions that you might want to work out a bandplan with a local club.

I did some design work for this outfit some 15 years ago. Astro were
taken over by Norlin Communications at Alexandria, just outside
Washington DC. I do not know if they are still there or if they
would still have the old Astro data available.

376. Measure? Loop loss resistance

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-09 00:00:00 UTC
From: AMDX <AMDX@worldnet.att.net>
Message-ID: <01be3bf4$0c03fec0$66874d0c@default>
Source record: 74936

Problem: Measuring Q of high Q loop (Q=700 to 1000)
Proposed method: find R loss---- Q=Xl/R
(yes there are other {better ways?} please bear with me)
The model is a source with a series resistance.
I will be inducing a voltage into the loop from a source several
feet away.
To find R loss I want to insert a transformer pri in series with
the loop. The pri will look like 2 ohms reflected from 50 ohm sec.
Measure an induced voltage. I can measure this on a spectrum analyzer.
Then change the transformer to 4 ohms reflected from 50 ohm sec
Measure an induced voltage.
From these two voltages and known resistance change, R source
(R loss) can be calculated.

Now the Question--By adding 4 ohms I have lowered the Q, does that
lower the voltage induced in the loop? (Meaning the source voltage has
changed) If so, is there still a mathematical way to calculated the R loss?

In the end I want a transformer with a pri that matches the R loss when
the sec is terminated into 50 ohms.

377. Re: Q:Homebrew Wadley Loop HF RX

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-09 00:00:00 UTC
From: c.c.tqbssz@QXHomebrew.killspam.us.com
Message-ID: <77844u$a5$1@samba.rahul.net>
Source record: 74937

Jim (jbolinger@lintek.com) wrote:

<A confusing and not very correct description of the Wadley loop>

The RX can be separated into two functional blocks;

The simple part is the back end which is a conventional tunable IF, in other words a superhet tuning a fixed 1 MHz range. Tuned by the second (KHz) VFO which needs to be high stability. There is no drift cancellation for this VFO.

The front end converts the HF band down to the tunable IF range in 1 MHz steps, controlled by the first (MHz) VFO. The first VFO runs above signal frequency and is used in 2 conversions;

a) By itself as the local oscillator in an up conversion to a wide band (> 1MHz) high frequency IF (45 MHz in the RA 17) first IF.

b) Mixed with harmonics generated from a 1 MHz reference (the comb generator) and filtered to provide the local oscillator for the second conversion down the tunable IF range.

Mixing the first VFO up and down cancels any drift in this section of the RX.

Here how it works;

Suppose the first IF is 44 to 45 MHz.

The first VFO will tune 46 to 74 MHz for a 1 to 30 MHz signal range.

Suppose the second IF tunes 4 to 5 MHz

The local oscillator needed for the first to second coversion will be 40 Mhz.

This 40 MHz comes from the first VFO mixed with harmonics from a 1MHz xtal and fed to a 40 MHz filter. This combination can only produce an output at 40 MHz when the VFO is at some multiple of 1 MHz.

Eg VFO 60 MHz, - 20th harmonic of xtal = 40 MHz
VFO 61 MHz, - 21st harmonic of xtal = 40 MHz

If the VFO is at say 60.5 MHz there's no mixing product at 40 MHz and therefore no injection to the second mixer. As you tune the MHz VFO you can hear increases in noise as it passes thru each MHz point and the second mixer gets a local oscillator signal.

To cover 14 to 15 MHz, the MHz VFO is set at 59 MHz, this mixes with 19th harmonic of the xtal to generate the 40 MHz injection signal.

Suppose the signal is at 14.2 MHz, mixed with 59 MHz gives a 1st IF of 44.8, mixed again with 40 MHz gives the second IF of 4.8 MHz.

If the MHz VFO drifts to 59.05, the 1st IF will become 44.85, but the LO injection will also change, from 40 to 40.05. 44.85 - 40.05 = 4.8. Bingo! the second IF frequency is unchanged, the drift has been cancelled out.

I picked up a Motorola radio a while back that does not have an ID plate on it. I tried the Motorola web site with not lock. Maybe someone out there can ID it for me from some of the part numbers. It is a one channel radio with the mike connector on the left side and a UHF connector on the right side of the front panel. On the rear is a six (6) pin cannon connector and a heat sink. On the from panel are the following controls from left to right: Volume, on/off, PL on/off, Squelch.
The following modules are in the plastic case mounted to a metal chassis. NLB10332ASP2, NLN6591A. Also connected to the unit is what looks like a power converter labeled 24-72V, NPN6044A. Any help ID'ing this unit is appreciated. I can be e-mailed at rainsbe@gte.net.

> -bob
>
>
The HRO-500 used a PLL to get the injection to the first mixer, At first glance it might appear similar to the Wadley loop because the phase comparator took it's inputs from the VCO and a crystal oscillator with high harmonic contents, in effect locking the VCO to a harmonic of the crystal. And you did tune the VCO manually to get it to the next lock point. But if the hardware had been up to it at the time (early sixties), the synthesizer would have looked like what we are used to now, with a VCO feeding a divider chain and then the phase comparator.

Radio Shack had a shortwave receiver that used the Wadley loop, though I can't remember the model number.

And Barlow-Wadley themselves had a transistorized portable that used the loop, in the early seventies. Undoubtedly it was alot cheaper than the Racal, and so perhaps it made the loop more prominent. I'm still not sure if it's the Wadley loop or the Barlow-Wadley loop, and I think perhaps this confusion comes from the populariztion of the loop in that portable.

Are you looking for the AGC amplifier only or if you want also the AGC detector which will control the said AGC Amplifier. Is this for an FM signal or an AM signal. AGC detectors are simple for FM because the amplitude of the signal is constant. For AM, it is more complex if the AGC detector must respond to the peak level of the signal. Regards! Yvon

Hi:
It seems to me with the proliferation of 6 meter operation and legality of a kilowatt on the band, that you would be better on one of the 72 MHz frequencies. I guess they are still available, maybe I'm behind the times.
Good luck anyway.

I don't know anything about the TS-430, but this sounds just like a
problem I experienced with a digital readout on an X-Y table. The fix
was quite simple. It turned out that debris would get in between the
"encoder", which was a glass bar with a pattern etched in it, and the
sensor. And a bit of disassembly and carefull cleaning was all that it
needed.

I suspect that your fix may be similar: just a little cleaning required.
But unless you're confident that you can get it back together correctly,
once you take it apart, you may want to have a service shop do the work.

Depending of the bandwidth of the output transistors, this may be
sufficient for the 135 kHz amateur band, which is currently available
in some European countries. Some (FET) audio amplifiers with large
bandwidths are used on this band (and on the 73 kHz band in UK), some
may need some tweaking in the frequency response of the feedback path.

: I heard someone talking the other day on 40 meters about using
: a stereo amp as a HF amateur radio amp. Is this possible?
: Anyone know if it can be "converted"?

Not directly, the output transistors would be far too slow, but it
could be used as the speech amplifier to drive a modulation
transformer to produce A3E modulation with a class-C transmitter.

a variety of filters are available (240, 280, 480, 960khz.....). Might
be interesting to try to find a circuit, possibly using some series
trimmer capacitors to tune the series resonnance frequency.
The only application I have seen is using 7040kHz resonnators to improve
40m front-end selectivity, using two resonnators the receiver just
covered 7-7.1MHz ham-band, and rejected the very strong bc stations
above 7.1MHz

Most of these programs use what's called the SCA (which stands for something like "secondary carrier audio" - I'm sure someone will correct me since I'm probably wrong on that...I've simply used the abbreviation for years) which is a kind of hidden channel available on FM frequencies.

In other words, an FM radio station can, if it chooses, add in this second channel to its regular broadcast. This programming requires a _special_ radio tuner to decode it.

Most listeners to these SCA broadcasts lease/buy the tuners from the broadcaster, but you can find/build them yourself with a bit of searching.

Many of the local FM stations use this channel. Some, as you noted, for ethnic special programming, others use it for similar niche targets (i.e. reading books for the blind).

Why don't all of the broadcasters do this? After all, it sounds like an almost free way for them to get additional revenue... Aside from the equipment/power costs (which aren't that huge...) The reason is, that in theory, using this SCA reduces the quality and range of the primary FM channel

(Although I've never noticed any differnece myself when listening to stations that do, as opposed to stations that don't, run SCA).

Oh, the quality of the SCA itself is dramatically lower than you get on the main channel.

Hello Bill,

The Zi, Zo = about 2.2K (I think)

Incidentally, a normal RC coupled Comm Emitter Audio AMP will work perfectly
well as a IF amplifier at 455 Khz with about the same amount of gain as at audio.
(AGC might be acheivable with a shunt BJT NPN transistor as attenuator).

To narrow the bandpass, I think(shoot me if I am wrong), U should build a ladder
filter like they do with crystals, a 4 resonator + 2 IF can should give decent (4 Khz)
bandwidth with fair skirts.

Best luck with that IF amp.

402. Re: Q:Homebrew Wadley Loop HF RX

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-10 00:00:00 UTC
From: abcd <abcd@efgh.com>
Message-ID: <36993731.1CE9EF58@efgh.com>
Source record: 74825

Thanks for the very clear explanation of the Wadley Loop,
It seems that cleaner and easier way to generate the second IF
conversion oscilator at 40 MHZ would be to use a analog translation
PLL-VCO for filtering and translating it, instead of the
mixer + sharp 40 MHZ filter .

U would still need the COMB generator ,unless,
U decide to replace that with another PLL.

```
1St Mixer 2ndMixer
--------------X1--------X2--------(4-5 Mhz Variable IF )----------
| |
VCO1 VCO2 <-LPF
| APLL |
| | |
---------- X3 ---P1 <<<< APLL Mixer
|
|
1Mhz Comb----------------------|
```

X1 = 1st Mixer
X2 = 2nd Mixer
X3 = Translation Mixer
P1 = APLL phase detector
LPF= Low Pass filter that effectively replaces the 40 Mhz BPF

Thanks again !

The operator you heard on 40 meters probably bought his lisnce from
the local club (in my area, they sell them cheap to increase club membership)
ANY one knows!? to operate an amp on HF you need a TANK circuit, or else!
Do you have a TANK sircuit in your HEATHKIT stereo amplifier?

To add to Danny's comments - if the original poster lives close enough to NYC to visit Chinatown, it should be pretty easy to get an SCA-equipped radio. The problem with these is that they are pretty much single channel jobs and this deprives you of the ability to go exploring the band through the ears of an SCA decoder. There are SCA kits out there, and an outfit that can retrofit the GE SuperRadio series with high quaality demodulators. However, the novelty wears off quickly unless you have a particular interest in some of the speciality programming - which is diminishing all the time.

>Uhh, the chassis might work.

I've saved this note received via packet network:
Fra : G0MRF
Til : 136KHZ@EU
Sendt : 15-Nov 16:39
Mottatt : 17-Nov 00:31
Type/status : B$
BID (MID) : 6702_GB7DEO
Meldingsnr. : 395155
Tittel : 136kHz Amplifiers.

From: G0MRF@GB7DEO.#32.GBR.EU
To : 136KHZ@EU

Power Amplifiers for 136 kHz.

The 136 kHz band is in a portion of the spectrum where it should be possible to use "normal" RF amplifiers, or high performance audio amplifiers.
The following notes on amplifier performance may be of interest to anyone considering building transmitting equipment for the new allocation.

Maplin 150 Watt MOSFET audio amplifier kit.

This kit has been a good starting point for operators on 73 kHz and easily produces 100 Watts on that band. Some quick tests have shown that the amp will produce power to greater than 150kHz.
When using on 136k, the zobel network across the output dissipates excessive power. The existing 4.7 Ohms and series 0.1uF should be replaced to prevent "fires"! A 2 Watt carbon film around 10 Ohms and a 47nF ceramic appears to work well.
At 136kHz the amplifier has similar gain but is less efficient with the FETs increasing their dissipation. Even so, an output of 70 to 75 Watts is achievable, slightly more if you're prepared to push the transistors.
The Maplin amp seems to be based on a Hitachi application note. This shows two pairs of FETs in parallel which could give us 150 W on 136 kHz.

A 100W HF amplifier using low cost MOSFETS. Rad Com Feb / March 93.

This conventional amplifier uses a pair of 2SK413 FETs. The Rad Com article shows the lower -3dB point as 225kHz. Following publication, a commercial company based an MF navigational beacon (1kW PEP) on a much

modified version of this amplifier.
The lower -3dB of the published design is limited by the RF coupling and decoupling capacitors.

The following changes allow the amplifier to operate on 135kHz at 100 Watts.
C3,4,9,10 FROM 47n TO 0.47uF (INPUT COUPLING)
C19,20,21,22 FROM 10n TO 0.47uF (OUTPUT COUPLING)
C7,13 FROM 47n TO 0.47uF (BIAS DECOUPLING)

The disadvantage of this amp is that it requires about 5W drive power (not just Voltage as the Maplin amp). Also, a severe mismatch into the antenna will not be appreciated by the FETs.- Tune up on reduced power.

Additional possibilities.
1) Replace the 2SK413's with some higher Power/ Voltage FETs. (2SK1120?)
2) Add two more FETs in parallel to produce 200 W
3) Bias to class C and increase the efficiency
4) Replace the output transformer with an easier to use 3c85 ferrite toroid

Low power PA's or Drive Amps.
There are several easy to use audio power amp IC's which operate above 136kHz.

TDA2006 12 W to 150k
TDA7052A 1 W to 300k
TDA2030 18 W to 140k
All available from Maplin

Thanks.....David G0MRF

Source record: 74837

I'm trying to set up some sort of ground link on microwave, and I was wondering if a Uniden 700 receiver can power up an RCA DDS Dish?

I understand the DDS dish is quite broadband, but I don't want to blow the brains outta either piece of equipment, ya know?

I don't have spec sheets on the DDS to help me, or I think I would have had a head start.

Thanks for your reading this an help!

Remove NOSPAM to reply directly or just post it. Thanks again!

Hi
Does anyone have a suggestion on how to cure electrical noise in a 1995 Saturn Sw-1? It varies in rate of pulses to the rpm of the engine. I have grounded the engine hood and put filters in the dc line which is hooked directlty to the battery.

Wayne VE3JET

Yvon,

It is interesting to read of the challenges you encountered in designing
a synthesizer that covers a full octave bandwidth. I ran into similar
```

difficulties in trying to produce a very clean, low-noise signal from a synthesizer covering a range of 72 to 102 MHz. I finally circumvented most of the problem by not using a varactor diode to cover the large tuning range.

My homebuilt HF transceiver uses a small mechanical motor-driven variable capacitor for coarse tuning the loop. A varactor diode is used in a conventional way to complete the remainder of the loop and has a capture range of only a few percent of the range covered by the motor-driven cap. Perhaps this is not the most elegant solution, but it may be of interest to amateur builders who want want to use a single 12-volt supply. No voltage converter or high-voltage integrator is needed.

The small tuning range means the varactor diode circuit is less subject to unintended modulation by diode noise, switching circuits and other noise sources. Of course your design would also be less affected by such problems because of the large voltage changes used to tune the diode.

Reduced reliability is a possibility in a mechanical system. It's also harder to protect the motor-tuned VCO (voltage controlled oscillator) from mechanical disturbances or vibrations. PLLs and other synthesizers are interesting. The charge pump circuit sounds like a neat solution.
I have more info about my project at:
http//:www.flash.net/~randylh/
Regards,
Randy, WI5W

Chris, something I've noticed about the LOSA is that there are quite a few links that are 404's. Thus, there's a brief description in the LOSA about something that sounds interesting, but only a link to the website for more details. Click on the link, and you get 404 not found. This is annoying. Is there a way to ensure that the details for a specific application mentioned in the list are also included in the list, so as not to have so many not found's?

This isn't true of the low-frequency ferrites commonly used at HF for broadband transformers and baluns. They'll go up in flames at flux densities well below saturation. Saturation is by no means the only cause of loss in ferrites or other magnetic materials; otherwise, none of the materials would be lossy at low signal levels.

I have a Heathkit AA-1800 Stereo power amp 250watts per channel
that I built a long time ago, and it's just sitting around. Works like
a charm and has very low noise (low THD) and it kicks hard.

I heard someone talking the other day on 40 meters about using
a stereo amp as a HF amateur radio amp. Is this possible?
Anyone know if it can be "converted"?

This sucker is 60lbs and the 2 main caps are HUGE and it's
got huge heat sinks on each side.

thanks,

sda

As an example of what has been done: For some years I used an L match made from a variable ribbon inductor that was originally part of a Collins autotuner. The original construction of the inductor featured an approx. 1.5 inch diameter fixed core of something (I assume ferrite) inside the active part of the cylindrical coil. I ran typical 200 Watt output and never bothered taking the ferrite's temperature. Maybe it caused losses for both me and the original application. Your opinion please: would you have worried about that core?

For those not familiar with the equipment, the coil changed inductance by winding or unwinding turns off of a brass cylinder and onto a ceramic cylinder having helical grooves so the silver ribbon conductor formed a solenoid. The mechanism was motor driven of course, so inductance could be automatically varied. And although we are interested in homebrew, I would not dream of home-building THAT inductor. (chuckle)

On Fri, 8 Jan 1999 13:22:19 -0500, "Jim" <jbolinger@lintek.com> wrote:

: As an example, it starts out with a crystal oscillator, say at 1 MHz. This
: is fed into a comb generator, which will generate lots of harmonics at 1 MHz
: spacings and is then filtered with a 30 MHz low pass filter. There is also
: a VFO. For this example lets say it runs from 70 to 100 MHz. Lets say
: there is also a narrow filter at 70 MHz. [It is called 'comb generator'
: because it looks like the teeth of a comb when you look at it with a
: spectrum analyzer.]

: The VFO is mixed with the comb generator and fed to the 70 MHz filter, which
: filters out all but one of the harmonics. The output of the 70 MHz filter
: is then mixed again with the same VFO signal to bring it back down to the
: original frequency (with another 30 MHz low pass filter).

: The result is, allegedly, a nice clean signal that can be switched in 1 MHz
: steps by tuning the VFO.

I have seen this wave analyzer type of circuit in some microwave
systems and also for selecting the desired harmonic of a pseudo-random
noise generators that produces a thick forest of discrete frequency
lines.

However, I do not think this is known as the Wadley loop described in
some other postings in this thread.

Since both the wave analyzer circuit and the Wadley loop require about
the same amount of hardware, why is the Wadley loop used instead of
the wave analyzer circuit in receivers ?

: It sounds neat, but there must be some catch or it would be used more often.
: I can think of a couple of possible problems. One is that the 70 MHz
: filter, in my example, would have to be pretty darn good to eliminate the
: unwanted parts of the comb signal.

The first unwanted signals are at 69 and 71 MHz, so fixed notches at
those frequencies should go a long way without using crystal filters
(expensive or not available for these frequencies in those days).

: The second is that any crud on the VFO
: signal will show up on the output, destroying the nice clean crystal purity.

The narrow filter between the mixers will produce a delay
(microseconds in this case) into the signal and if the VFO frequency
is rapidly changing (phase noise etc.), the signal is not remixed with
exactly the same frequency it was mixed before the filter, thus
producing a frequency error at the output. However, if the VFO signal

going to the second mixer could be delayed by the same amount as the wanted signal through the filter, this error could be reduced.

436. Ceramic resonators in RX filter applications?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-10 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <3698cd59.42490694@news.erols.com>
Source record: 74965

I picked up a bunch of these little two pole 455 kc ceramic resonators from DIGIKEY. I'm thinking about doing some experiments to see if I can use them to narrow down the IF bandpass on my HB receiver for 80 and 40 (selectivity currently provided by only 2 IF cans)

Anyone have any experience using these things as filters? Should I look at them as series resonant or parallel resonant devices? Any thoughts on optimal impedances in/out? Any suggested circuits?

Ideas appreciated. Thanks, 73 Bill N2CQR

><A confusing and not very correct description of the Wadley loop>
...snip...
>Stephen

That's basically what's in my Drake SSR-1 receiver. The mfrs blurb is a classic case of marketing however. The 1MHz comb generator put out harmonics at all multiples of 1 MHz which of course, get back into the front end. The designers apparently couldn't get rid of them so marketing proudly announce that they have included a 1MHz marker signal at no extra cost!!!

Despite that, it's not a bad little HF rx.

Alan

Hello,

please help me: I am in need for a tripler, which gives the chance of converting a 5W-7W signal on 70cm band to 23cm.

I guess thats the easiest way to get a nicely strong signal on 23cm for test purposes, not cosidering cleanness or harmonics.

Thanks a lot in advance!

451. Regulated Power Supply Experts out there?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-11 00:00:00 UTC
From: Doug Snowden <dsnowden@ncdc.noaa.gov>
Message-ID: <369A1E5E.7614C2E2@ncdc.noaa.gov>
Source record: 74860

I have been intermittently working on an older Astron RS-20A power
supply that folds back at about 1/2 current (about 10 amps). I started
intelligently troubleshooting this p/s and have now resorted to
wholesale
parts replacement. It still folds back and the output voltage drops to
around
11.5 volts at this time. I replaced the 2N3771 pass transistors with
2N3055
xsistors (they have about 1/2 the current rating of the 2N3771). I
figure
they should still be able to handle 18 amps of current at full load
(right?).
Over a period of time I have replaced all of the active components and
one
1N4002 diode. I don't know if a bit of RF might be getting into the p/s
and
causing problems, or if one or more of the resistors that determine the
foldback
current is out of range. That is a question I have - which resitors are
involved
in determining this? I have removed the SCR that is for overvoltage
protection
temporarily just to take it out of the picture. If I measure the
voltages on
the 723 regulator when the p/s is operating until less load, things seem
normal
according to the voltage chart on the schematic... Any ideas ?

Doug Snowden

Back when I had a running decoder (about 10 years ago), if they had any
(audio) SCA, they usuallly had 3 seperate subcarriers, 67, 75 and 92 kHz,
as I remember. The data signals, pagers and stuff, was less standardized.
Mostly elevator music, but I've picked up talking books for the blind,
southeast asian (Seattle), and greek (on a US station, for the Vancouver,
BC area).

It is partly physics and partly careful design.

If you have a 'square' pulse you will have lots of harmonics and the amplitude of the harmonics will fall off as sin(x)/x, with x being proportional to the width of the square wave.

When you make the pulse very narrow the harmonics will be relatively flat to a higher frequency. You can never get them completely flat for all frequencies (unless you use zero pulse width!), but you can get them 'good enough' over a limited frequency range, particularly if you use some type of filtering (the 'careful design' part).

Jim

I really don't know about the HF powdered irons. On the one hand, they have very low loss, so you could get a whole lot more flux density before they heat up. On the other, they can handle a whole lot more flux density before they saturate. It would also depend on several other factors. For a given applied voltage, the flux density increases in inverse proportion to frequency. The loss, on the other hand, is a somewhat complex function of the core size and shape, frequency, and number of turns. It might be possible to come up with a rule of thumb, but I've never done the exercise. I'll put that on my lengthy list of things to do when I have time.

No, the 8640A is not a military set, just an obsolete discontinued
one. I bought one at Donnington Park (Leicester Rally) last
September with a known power supply fault in order to canabalise it
for an 8640B that I wanted to fix and improve. I only needed one
thick film amplifier module, the variable frequency modulator and
some knobs and front panel trim, so the major components are all
still intact. If you buy one and need something, let me know.

Regards Randy!

I have built a similar system using a mechanical TV UHF tuner. The AFC veractor on these units can swing the frequency plus/minus 1 mhz. The tuners have a frequency coverage of 514 to 931 Mhz. (Channel 14 to 83) I installed 2 small loops inside the cavity, one for the RF output and one for the pre-scaler. The RF output gives approximately 100 millivolts into 75 ohm. I use a MATV amplifier OM360 to raise the level to plus 7 DBM min.to feed a hot carrier diode balanced mixer. I also use it with a divide by 2/4/8 as a signal generator which is very useful. Further dividers can generate very interested signals to be used as VFO The variable capacitor is used as a course tuning and the AFC input is adjusted for fine tuning and for locking through a PLL system.

Source record: 74873

Mike OM,

Why not measure the -3 dB bandwidth of the antenna? You can measure this by receiving a steady signal after having matched the loop at that frequency. Then tune the receiver either side until you see 3 dB loss in signal. The operating
Q of the loop is then F/BW (freq divided by -3dB bandwidth). The unloaded Q
of the loop is twice this value, if perfectly matched.
You can then calculate the loss resistance if you want, knowing what the theoretical radiation resistance is. (Radiation resistance is closely approximated by
Rr = 197 * (circumfrence in wavelengths)^4. See either edition of Kraus's book, "Antennas").

Example: if F = 7000 KHz, and -3 dB bandwidth is 7 KHz, then the Q is 7000/7 = 1000. Q= Xl or Xc divided by (Rrad + Rloss), from which Rloss can be calculated.

No, just old. Looks like the last year it was made was 1991 for the 8640B. I doubt I can find a manual for one here (we do disk & laser printer stuff here), but I'll look around.

It is pretty straightforward, 0.5 to 612 MHz (with option 002 it can be doubled and go to 1024 MHz, look on the serial number label for option info, probably). Built in freq counter, can do AM or FM modulation. This info is from my 1991 HP catalog, list price was a mere $14,600 (+ $1255 for option 002). The service manual is listed as part number 08640-90215, operator manual looks like it has part number 08640-90208. I don't know if you can still order them though.

The HP 8640A is a commercial signal generator - no doubt used by the
military too.

IIRC the 8640A is a free-running device, the 8640B is a phase locked version
using a tuning motor and varicap to drive the cavity tuned oscillator. The
basic frequency coverage is 256-512MHz with some overlap at the ends. For
frequencies down to 1 MHz the 256-512MHz output is divided by 2^n before the
output amplifier. I think that there was a frequency doubler to increase the
range to 1024MHz

IIRC the instrument was manufactured in the early '80's and was (and still
is) a pretty good signal generator - particularly for those who can drive an
instrument that doesn't have a key-pad.

i am not qualified to have an opinion, however this is what my dear departed dad [an old time ham, w9klm] did with every new crystal he bought. he had a set-up that he put every crystal into that ran it hot for a couple of days. he said this was to age the crystal to a stable value so that he wouldnt have to worry about it changing later as he used it. i dont remember what the % of over voltage was, even though he had said at the time, but the crystals got warm to the touch. i had also asked him if you could do this in the oven. he said no, because the crystal had to be in operation as the heat worked on it. he ocasionly ruined a crystal doing this but not too often. he blamed them on bad crystals anyway. i dont know why i remember this odd thing but my memory is very specific about it. HOWEVER..... i am not a technition or ham radio guy so if you blow up the place then i will be very sorry, but it wont be my fault.

Ten turns on one of the standard transformers used for broadband
linears.

The kind with the ferrite beads on the brass tubes where the brass
tube becomes a one-turn winding and the impedance at frequency is
determinad by the ferrite mix...

They are available from RF parts.

The tube sockets can get really expensive for new construction on
those 4CX1000A (or B) tubes.

A better choice would be a 3CX1200A7 which will plug into an old
3-500Z or 4-400A socket!

Grounded grid the 3-1000Z would run rings around the 4-1000 with 150 watts max drive...

But for future replacement of the tube, the 4-1000 will be cheaper and easier to find.

Or if you want to run the 4-1000 as the true tetrode that it is and grid drive it, then the 4-1000 would also be the better choice..

Doug,

I'm not familiar with the Astron, but all 723 supplies are basically
the same....

Sounds like your current sensing resistor has changed in value.

It connects between pins 1 and 10 on the metal can package or between
pins 2 and 3 on the dual in-line package.

For a 20 amp supply this resistor would have a value of about .03
ohms....

The DSS expects voltages of 13 and 18 +/- 1.0 volt. These voltages are used to switch the LNB between Left and Right Hand Circular Polarization. The feed receives 12.2-12.7 ghz (K-band) and down converts that frequency to 950-1450 mhz which is then used for tunning the IRD. The feed alone produces appox .5 - 1.1 db of gain the dish provides appox 24 db of gain.

One point you didn't take into account. The original poster mentioned
that he had a 4500 v power supply. That would make the 4-1000 the
choice. The amountof drive needed to put out 1400 watts with the 4-1000
tube would be in the order of 130 watts. That would also point to the
4-1000.

Max plate voltage recommended for the 3-1000 is 3000 volts. Whereas the
4-1000 can take 6kv . Been there, Done that.

The 3-1000Z is also rated at 6KV max plate. It works fine at 4500 volts with a 10V amplified zener in the cathode return circuit. 100 watts in will give you more than 2KW out and it will run a lot cleaner than the 4-1000....

> Max plate voltage recommended for the 3-1000 is 3000 volts.

Recommended, not RATED!

Max plate voltage for the 3-1000Z is 6KV just like the 4-1000.

The recommended voltage for a 2KW power input is 3KV. This is a HAM RADIO spec put in the catalog to get your attention...

> Whereas the
> 4-1000 can take 6kv .

Once again, they will both 'handle' 6KV.

> Been there, Done that.

So have I, and I still have 2 new 3-1000Z's in stock that I haven't needed yet!

But thank you for your input...

> to be present to extract the audio.

This was actually how it worked, back in the days of vacume tubes. The
output of the tuner was fed into a very broad band 45 mhz IF. This was
usually refered to as the vidio IF an was 6 mhz wide. The vidio was
demodulated with a simple diode detector and simultanrously sent to
the vidio amps and audio IF, which was at 4.5 mhz. Since the vidio
detector mixed the audio and vidio signals together producing the
diffenence signal of 4.5 mhz. The audio signal was then amplified
and detected with a quadriture detector and viola...sound.

Of course there where a number of traps and such to eliminate any
vidio component (buzz) from the sound and sound component (Sound bars)
from the vidio.

Of course these days everything is done on one chip.

This may be a very difficult problem to cure.
The Saturn body is a polymer (if I recall correctly). The RF characteristics are similar to those of Corvettes (made of fiberglass). While I don't own and never have owned a Saturn, I know how difficult some RF problems can be to cure in metal vehicles, I'm guessing you're in for a long search for a cure. Items under the hood, the alternator, the ignition rotor, etc (little spark-gap transmitters) can either send the noise through the electrical system, for which filters would most likely be the fix. These under the hood items also "broadcast" the noise such as the case in my 1990 GMC pick-up. I had all the right filters in place, had a new alternator and rotor/distributor cap, etc. Still had lots of noise but when I disconnected the antennas, the noise went away. It was obvious, the noise was being broadcast from under the hood. I grounded the hood...no more noise. My GMC is metal. I don't think Saturns are. I didn't mean to put a damper on your problem and I didn't mean to get so long-winded only to say, give a call the a Saturn service department. If they really are the way they make them seem in the Saturn commercials (very friendly and helpful) they might be able to help you better. you are most likely not the first ham to own a Saturn with a noise problem. Good luck, Wayne. 73 de Tom KB2FIK Tbone107@aol.com

Source record: 74772

I'm looking for either a commercial, low cost IR data link or some published literature on a DIY version. My need is for an outdoor, free space, 1 MBaud, one way data link that is good to 300 meters or so. I realize that there are commercial IR LAN transceivers available, but these are too sophisticated and very expensive. Most of the amateur designs I've seen are capable of voice and or music transmission using IR LEDs operated in FM mode, but aren't capable of the needed bandwidth. Does anyone reading this newsgroup know of any construction articles dealing with this type of device? IR, eyesafe lasers could also be considered.

Thanks,

Peter

We used an old crock pot filled with common playground sand. We'd bake the crystals on "low" from when they were received until we would use in production (but, we made sure at least a month). The improvement we saw was pretty impressive in cutting down the usual high slope aging in a new crystal. We saw simple 4 MHz crystals hold their aging to as least as good as $100 Vectron units. Sorry I can't give more quantitative info, but this was about a decade ago.

Over Xmas I have been playing with the 15mtr mod on my chipswitched President Lincoln, since I got the password to open the radio below 24.8MHz.

The radio now tunes down to 20.900 MHz on the display. However the radio transmits and receives on a different frequency to that of which is displayed on the LCD readout of the radio as soon as the radio is below 24.800 MHz.

For example:

24.8000 MHz to 29.9999 MHz works 100% both on TX and RX.

If I tune to 24.7999 MHz on the radio's LCD, the radio actually transmits and receives on 25.0775 MHz

If I tune to 24.7000 MHz on the radio's LCD, the radio actually transmits and receives on 24.9860 MHz

If I tune to 24.6000 MHz on the radio's LCD, the radio actually transmits and receives on 24.8860 MHz

If I tune to 24.5000 MHz on the radio's LCD, the radio actually transmits and receives on 24.7860 MHz

If I tune to 22.7000 MHz on the radio's LCD, the radio actually transmits and receives on 22.9860 MHz

If I tune to 22.6300 MHz on the radio's LCD, the radio actually transmits and receives on 22.9160 MHz

Have you come across this problem before? and if can you let me know of a fix. It's really strange as the radio works 100% down to 24.8000 MHz and if I drop just 0.0001MHz to 24.79999 MHz then the radio fails to TX on 24.79999 MHz. But TX's and RX's instead on 25.0775 MHz.

I look forward to your comments.

So sorry, but I beg to differ. See, for example, the data
in the Amidon catalog on loss versus flux versus frequency.
At low frequencies, you can reach saturation safely; at high
frequencies you are typically limited by core loss well
before saturation. (It's a problem I'm currently dealing
with in the design of a 3MHz switching power supply...)

i'd like to know if anyone out there is using the r/c allocation in the 6m band here in the states?

i want to convert my gas burning 4wd street car over from the 'cb band' the radio equip is in now and get some r/c gear made for the 6m ham band.

my xtra rural setting has several multi kilowatt cb'ers that just hammer my microwattage r/c. the car freaks out and pegs the accelerator and spins around and around till it runs out of gas or hits something. when it's goin' 40 to 50+ mph you can't just 'catch it' and turn it off.

anyone have any websites etc. i could check into?

I have surplus to requirements a CTE transverter which is similar in
size to your 2600. It has a 10/11m input for around 25-30w out on 40m.
All mode and 12v operation.

150 USD plus shipping if you're at all interested.

I'm located in the UK. Shipping would not be expensive at around 20
bucks.

That's the problem, matching the loop at that freq. I need to know Rloss
to get perfect match.

>
> 73 and GL,
> Don, W6JL

I have attempted to look at the 3db point with a scope probe (10x) isolated
with a
1 Meg resistor. The problem is the sig gen has to be driven hard to get
enough
signal to see. Then the loop picks up reflections in the room, the scope
picks up
signal direct from the sig gen. If I direct couple the sig gen to the loop
with
appropriate isolation then I have two items (scope and sig gen)to load the
loop
and lower the Q I'm trying to measure. (The problems are amplified by the

very high Q)
Since I posted the proposed method I have been told that by changing the load
resistor (reflected from 50 ohms) the Q is lower and when the Q is lower the
voltage developed by the loop is lower. So the method of treating the loop like
source with a series resistor won't work. (I'm still not sure some math would not
solve that also)
When I talk about a source with a series resistor, I'm thinking of a battery,
it acts like a perfect voltage source with a series resistance.
You can find the value of the series resistance by loading the battery with R,
and measure the voltage then load the battery with R/2 and measure the voltage.
Then R/(R/2)=dC

R series resistor = R x (1-dC) / (2dC-1)
And if that does not start you thinking you must have a life! :-)
Anyway I'm having fun learning how to do this.

Mike

Hello there,

I'm looking to buy a Radio Shack car alarm module that's now discontinued.

I would really like to have the diagram for it that is/was printed in the back of the owners manual. It's not available through Tandy any longer.

The Module is the: Moblie Alert, Keyless Electronic Vehicle Alarm Module

The RS stock number is 49-751

If you have one, dead or alive, please contact me at the E-mail address below my name. I'll be happy to pay for a photocopy of the circuit diagram.

This module will replace one already installed that was damaged past repair.

thank you

skipp

>range to 1024MHz

The 8640M and 8640B can be phase locked, but only in fairly large steps.
There is no motor. You tune manually, then switch to lock. There is
a fine-tune knob as well as the main knob that covers an octave.
There are banks of filters to get the divided-down square wave cleaned
up and pretty low harmonic distortion. It covers to just below 455kHz,
to get the common low freq IF. They also have a pretty decent attenuator
for low-signal outputs...I assume the 8640A does as well.

The set was HP's first non-tube RF generator, or nearly the first, and they
were keen on upholding a reputation. There are a few HP synthesized
gens that have lower phase noise, but an 8640 A or B in good shape is
no slouch in the phase noise category. If you can find an 8662 at a
reasonable price and it's in good working shape, by all means get that
for exceptionally low phase noise (and very fine frequency control...
fully synthesized). There was a good article in the HP Journal on the
8640, and it may possibly be on their web site (though unlikely).

Tell them to send me an e-mail address that I can send copies of your SPAM to!

I'd like them to see what you are trying to sell on the CB newsgroup.

Maybe they can set up a phoney 'buy' and you won't have a license any more!

533. Looking for CTC TX75 RF power transistors

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-13 00:00:00 UTC
From: Charlie Thompson <xctx@onr.com>
Message-ID: <77jmui$et4$1@news.onr.com>
Source record: 74720

I'm repairing an HF power amp that uses TX75 RF power transistors.
RF Parts has a non-exact replacement....looking for an exact replacement
if anyone knows of one.

thanks in advance,

W5CDT

Best bet is to phone up filter manufacters sales deptartments and try
and blagg a few samples for free. You may need to spin a yarn...

Sign your pages up to the website garage, or some other web page checking
service. They will give you a set of diagnostics, and check all your links,
etc.

Its free, too, and they email you once a month to update you.

FOR SALE

Johnson 6N2 missing ONLY THE METER as best I can tell. (I have information on a meter that may be available in a parts unit if you are interested.)

The front panel and knobs are in pretty good shape...I suspect the panel would be a good 8 or 9 with some cleaning and polishing and the knobs look very good.

The case is without dents except for one corner that needs some reforming (upper left). Take a look at the picture.

The tubes are all there, including the 5894, but they are untested and the only things I know are missing is the hatch for the crystal socket, the screws for the case and the meter. There's even a crystal included with it.

This is a chance to have that unit that goes with the Ranger and later Johnson HF rigs or even the earlier Viking I or II. Restore this and you'll have the entire transmitter coverage from 160 meters through 2 meters! Just like the 1950s!

$40 plus you pay shipping and insurance if you want it. It's relatively light and I'll pack it well.

Pictures are at:

>The Saturn body is a polymer (if I recall correctly).

Hello Tom,

Most of a Saturn is steel. Some body panels are polymer or polymer coated. There's a metal framework, as well. My magmount sticks to the roof - in the right spots.

>The RF characteristics
>are similar to those of Corvettes (made of fiberglass). While I don't own and

>away. It was obvious, the noise was being broadcast from under the hood. I
>grounded the hood...no more noise. My GMC is metal. I don't think Saturns
>are.

The hood and trunk lid of my 1994 are metal. Don't know about 1995 models, but a magnet will tell.

Saturns don't have distributors, either. Two coils, one for each pair of spark plugs.

>I didn't mean to put a damper on your problem and I didn't mean to get so
>long-winded only to say, give a call the a Saturn service department. If they
>really are the way they make them seem in the Saturn commercials (very

>and helpful) they might be able to help you better. you are most likely not
>the
>first ham to own a Saturn with a noise problem.

Good advice. I've never had the least problem with service from them.

But I still miss my old car. No noise problems at all. It was a 1980 VW Rabbit with the diesel engine. No spark plugs, no distributor, no computer. Only possible source of noise was the alternator, and it was stone quiet.

The Lincoln will operate very well in 10, 11, AND 12 Meters
IF the person doing the modifications knows what he is doing.
After the Chipswitch IC is installed, the 12 Meter modifications
are done, then the radio must be adjusted to get equal operation
on all channels. The one person that does the very best at this
is Derrell Adams of Valley West Electronics. He also serves as
the Chipswitch service person. From the Chipswitch Service page,
http://www.chipswitch.com/Service.htm you will read:

"Only if you cannot contact your installer,
or you installed the Chipswitch yourself, call:
Derrell Adams, at (801) 269-0130 between
the hours of 7pm and 10pm Mountain Time Zone(USA)"

Please only call him during the hours listed if you'd like him to
modify your rig!

Others have tried to create a 12 Meter Kit/Modification, but
Derrell is the only person who has perfected it. Dan Valentine
programmed the Chipswitch IC with input from Derrell back in 1991.

Tom, just omit the "always" from my posting and we will be in full agreement.

Who's Amidon ?

Years ago, from my measurements around 2 MHz on HF ferrites, with Mu around 200, there was no sudden onset of saturation and other losses were quite small in comparison. Very high material resistivity means very small eddy current loss. At the time I was interested in push-pull class-B linear amplifier design, particularly power ratings.

(BTW - there is no such thing as a conjugate match in class-B linears.)

Oscillosope examination of the voltage across across an inductor when the current flowing through it is constrained to be sinusoidal, shows the effect. Non-linear waveform distortion is apparent before there is much increase in core temperature. Admittedly, the rate at which distortion increases with flux density also increases, but the effect is smooth. So even at relatively low core loss, loss is due to non-linearity.

If I remember correctly, with steel transformer laminations, loss increases as flux density raised to the power of 1.6 The point of 'maximum allowable' flux density for different steels is quite arbitrary. With ferrites it is probably nearer to a square law but 'saturation point' is just as arbitrary. No point exists !

I understand ferrite circuits at the inputs of high grade receivers should be avoided. Otherwise wide-band signal cross-modulation effects occur. Loop-sticks in pocket transistor receivers are acceptable it seems.

Regards, Reg.

I've gotten samples and ordered small quantities from Trans-Tech Inc. in
Maryland. They've even cut the samples to the frequency I wanted!

They can be probably be found thru a web search by name and some keywords
like dielectric, resonator, etc.

Regards! It is done on one chip as you said. There are two systems in use in today's TV and VCR. The first one is the inter-carrier type which uses one SAW filter for both the visual and aural signals. The aural is attenuated about 20 DB in the SAW filter and the 4.5 Mhz aural FM signal is extracted from the quasi-synchronous video detector through a ceramic bandpass filter.
The second one is the split-carrier type which uses two SAW filters, one for the visual and one for the aural. This system has the advantage of being less sensitive to sound buzz from the video. It is my understanding that it is possible to get the audio information from this system if the video signal is missing as long as the quasi-synchronous detector is of the PLL type. The 4.5 Mhz aural signal is extracted from a "Q" synchronous detector which is fed from the VCO of the PLL. Philips has such a demodulator TDA 9800 or TDA9802. Yvon VE2AUC

550. Build a J-POLE Ant By K9QAM

J POLE ANTENNA PLANS

-

Roll up J antenna plans, part 1 of 2.

Just thought I would leave a bit of info about making your own twin lead roll up j antenna for 2 meters. I collect antenna designs, so if someone would leave thier favorite design in a bulletin, I would be in your debt. By the way, I have found this design to work quite well, and am using one mounted in my attic for all my 2 meter radio work. First off, you will need the following supplies:

Solder
Soldering iron
Heat gun (optional, but good to have. Available at hobby shack)
Coax Cable stripper (cheap but effective one available at radio shack, America's technology store)
Electrical shrink tubing
Electric tape
50 OHM Coaxial cable. I use RG 58/U. Center conductor is more easily manipulated if it is braided rather than solid.
I don't know if solid center conductors have any electrical advantages, but it took me a long time to learn how to deal with the connection to the twin lead. I like to buy it with BNC connectors on both ends, but that's just because I don't have the tools to buy bulk and attach my own connectors.
300 OHM TV Twin lead. I have found that the cheap Sav-on variety actually is better suited to the task, than the heavy, expensive stuff.
Razor blade or X-Acto knife (sharp. Dull ones are a real pain!)
Silicon sealant (also known as aquarium sealer, but less expensive)
Mini battery clips. These are available at radio shack, and while they are optional, they are very convienient.

Ok, down to brass tacks. First off, fire up the soldering iron, so it will be hot and ready when you are (somehow that didn't come out right hi, hi!)

Next measure out 55.5 inches of Twin lead and cut it.

1.5 inches up from the bottom end, make a mark on the twin lead. Half an inch above that make another mark. These marks will guide you in stripping the twin lead. you are going to need approximately that much room to solder in the coax sheild and core. I have found it most

easy to cut across the wire with the razor until I feel it touch metal
repeat that on the other side, then cut the center sheilding out.
Then it is a simple matter to remove the remaining insulation from our
target area. Oh, by the way, this will be your feedpoint, and it is
very important that you measure this accurately. The feedpoint is
critical.

Strip the coax so that you have the bare center conductor exposed, and
a little further up, exposed shielding. Cut down the side and twist
the shielding into a single strand.

Solder the sheild to one side of the twin lead, and the center conductor
to the other. One technique I use with solid core center conductors is
to bend it back in a fishook then solder to the twin lead.

Use electrical tape to fasten the coax to the twin lead. Only a couple
wraps is needed, as this is mostly just for strain relief in the
building stage. You may or may not want to do this before you do the
soldering.

End of part 1

Roll up J antenna plans part 2 of 2

-
16 inches from the bottom, cut the shield side. This is the "short".
Slightly above the original cut, Maybe an 8'th of an inch, cut it again,
then square out the plastic shielding slightly toward the center of
the twin lead and pull the little peice of plastic and conductor out.

Now is the time to find out if you have a solid connection. Get a radio
check. If you get a couple of poor reports, try resoldering the
connection.

Sqeeze some silicon sealer onto both the feedpoint and the "short".
We do this for four reasons. First, this effectively waterproofs the
whole job. Secondly, it provides structural strength. Third, it protects
the weak solder point from loosening with twists and turns and little
kids poking it with curious fingers. Last but not least, it provides
a permanent barrier between the two contacts so you don't blow the
finals in your HT!

Once the silicone has cured (the time required is usually overnight,
but I have managed to coax it along much faster) Measure a length of
heat shrink tubing to cover the "short" and another one for the
feedpoint. Don't be stingy, this is where we make this puppy look
really snazzy, and close everything up tight as a drum.

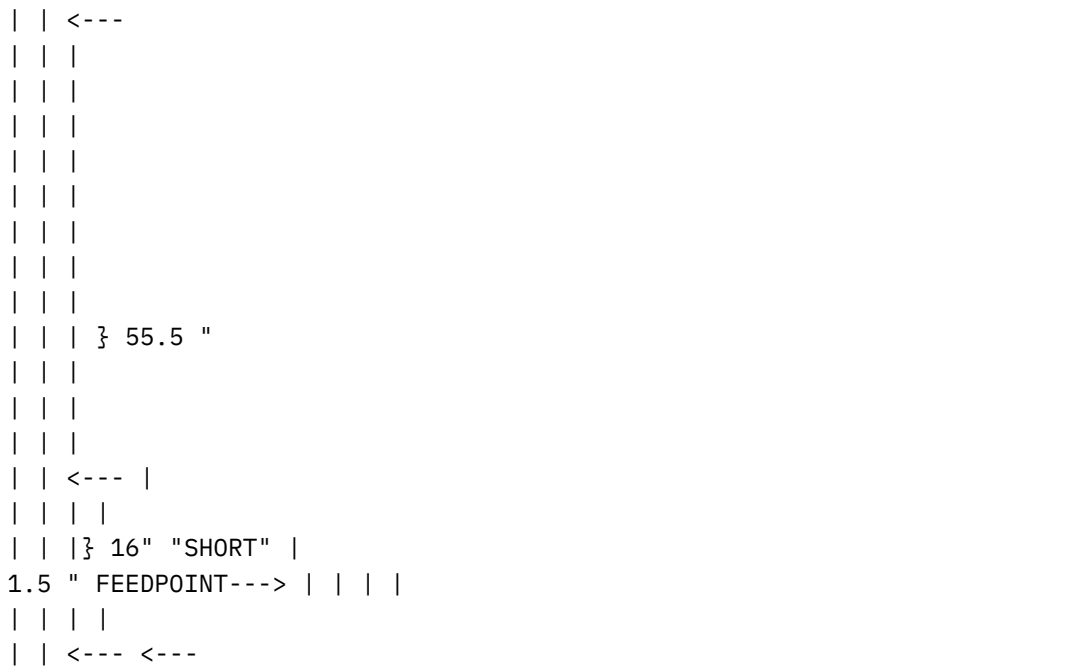
Now with heat gun in hand, heat the tubing evenly and slowly, allowing
it to shrink in it's own good time. Actually, it will shrink pretty
fast under a heat gun, and you know it is done when the ends curl up
just very *slightly*. I don't know how it behaves under a lighter, but
I have been told the effect is similar, taking slightly longer. I have

also been told that a good strong hair dryer can be used also.

Now make a hole in the end, and connect a mini battery clip with a shoelace or some other non conductive substance.

Be aware that this type of antenna has an annoying property. It tends to detune significantly in the prescence of metal, so avoid placing it near the stuff, if possible. I don't know this to be a fact, as I have never tested it myself, but I have been told that this design has about 3 Dbd gain.

Again, in summary:



If you want to have a little fun, you can stop by sav-on and buy a 75 OHM to 300 OHM matching transformer, (Used to connect cable TV to old TV's that don't have built in cable connectors) and solder that directly to the base of the antenna, rather than 1.5 inches up. That 1.5 inches is an impedance match, and with the 75 OHM matching transformer you don't
need it. Don't shorten the overall length or the "short" though! That will definetly throw a monkeywrench in the works! Oh and yes, I did say a 75 OHM matching transformer. That just happens to work out to, guess what? A 4:1 ratio. So in essence, you have a cheap but good 4:1 Balun for about two bucks. I stumbled on this quite by accident. To make this work you will need an adapter to go from the Cable tv size coax to Ham Coax, availble at your local swap meet quite cheap. This setup is nice because you can attach any length or type of coax that you want, and disconnect just as easily. disadvantage? It isn't a sealed system and I wouldn't place bets on how well it would work in wet weather without some kind of protection.

Well, hope I helped. 73's to you. And I am looking for any antenna plans I can get my hands on, so if you come across any, send them my way will you? Antennas have sort of become a sub-hobby for me.

73, Enjoy and good luck,

Ron Smith K9QAM <k9qam@empnet.com>

551. Re: Know any Electronic, Radio, or Test Equipment Surplus Stores in Toronto, Canada??

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-13 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.990113132915.16317A-100000@Ocean.CAM.ORG>

I haven't been in Toronto for a decade, so perhaps the scene has changed,
but it used to be that there was a cluster of electronic stores near
Active Surplus. I remember once (the mid-80s) finding out about one on
one of the nearby sidestreets because they'd put up some posters on Queen
Street.

tor.general is the Toronto newsgroup, and maybe posting there will turn up
some more recent comments about the scene.

Someone visiting Toronto (or anywhere in Canada, for that matter) might
want to visit the Radio Amateurs of Canada site at
http://www.rac.ca
They keep track of upcoming hamfests, and I think there's a list of
affiliated clubs, and there's also a list of stores that carry their
publications, so it's a place to check for ham stores in Canada (though I
don't know if it's a complete list).

552. Sophisticated Breadboard System/Digital Electronics Course FS

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-13 00:00:00 UTC
From: lmarti49@linknet.net
Message-ID: <lmarti49-ya023580001301991252330001@news.idt.net>
Source record: 74806
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.swap,sci.electronics.basics,sci.electronics.components,sci.electronics.design,sci.electronics.misc

I have the following mint condition, unused, high-quality equipment and
materials
to sell:

--1 HEATHKIT 3201A "DIGITAL TECHNIQUES COURSE"
(2 Volumes).

--1 HEATHKIT ET3700 "DIGITAL TRAINER,"
Includes a total of 4 insertion-type circuit breadboard cards
in a single, well laid-out package.
Also includes:
built-in +-5 and +-12v power supplies;
a variety of square wave TTL clock signal outputs at up to 100 khz;
a built-in DVM/frequency counter;
on/off led logic state indicators, buffered data switches; etc.

It's perfect for quick breadboarding of experimental circuits by means of
inserting component
leads and #10 wires in the little holes on the breadboard cards.

--1 KIT OF IC'S AND OTHER PARTS for doing the experiments in the course.

I bought these items in 1989 just before I became interested in computers
instead of electronics, so I never used them. I had previously taken
Heath's DC Electronics, AC Electronics, and Electronic Circuits"
courses, and found them unusually clear and easy to use, so I suspect this
course is also.

NOTE: This course teaches the fundamentals of digital circuit design
(e. g., AND, OR, and NAND gates; shift registers, clocking, Boolean
operations, etc).
These principles do not change, even if the hardware does.
The course does not teach computer programming, etc. so it should not be
out of date.
The accompanying ICs are TTL.
The course allows you to learn entirely on your own, by means of
"Programmed Learning".
The subject is broken down into manageable units, in each of which they
first tell you what
they are going to explain to you, they explain it, then present an
experiment demonstrating
it. There are periodic tests to help you synthesize what you've learned.

TOTAL COST NEW: $430
COST TO YOU $200, shipped.

:-) OK!

> Who's Amidon ?

www.amidoncorp.com. But also try http://www.ferronics.com/toroids.htm, and especially have a look at the "power inductors" section. You're right, saturation is somewhat subjective, but for "hard" ferrites, it sure seems pretty sudden. In any case, below or above some "saturation" limit, the energy dissipated per unit volume is given by the area in the hysterises loop around which you travel with your particular excitation. That happens each cycle, so if you increase the cycles per second and hold the excitation constant (follow the same hysterises loop), you increase the power dissipation in the core. Get to a high enough frequency, and you're in trouble well before you get to what most folk would call saturation. As I said, it's something that I'm keenly aware of right now because of my desire to use a very inexpensive stock inductor in an application where I care about core dissipation. I could design custom magnetics and get lower core loss, but the price would be ten times the expense for the inductor.

> (BTW - there is no such thing as a conjugate match in class-B
> linears.)

I'm not going to touch that one with a three-meter pole! :-)

> non-linearity.

Yep, quantitatively the area inside the hysterises curve the material is traversing.

> If I remember correctly, with steel transformer laminations, loss
> increases as flux density raised to the power of 1.6 The point of
> 'maximum allowable' flux density for different steels is quite
> arbitrary.

I had remembered a "rule of thumb" for small 60Hz power transformers
that copper loss was roughly equal to core loss for a well-designed
transformer. Someone in sci.electronics.design recently pointed out
to me that that's not true. I did some measurements and sure enough,
operating at rating typically the core loss was 10% and the copper loss
was 90%. The "saturation" flux density is obvious enough in that kind
of steel that you really don't want to be trying to run the transformer
into saturation, not because it increases core losses that dramatically,
but because the transformer winding inductance decreases and the current
goes up dramatically, and you end up with lots of distortion products
and I^2R heating.

But in the transformers used in (e.g. push-pull) switching power
supplies,
using hard ferrites at 100kHz and higher, it seems that the limit is
core loss, and that's well below the abrupt change in mu that would be
called saturation.

Interesting things to think about...nothing is completely black and
white and the gray areas in between are fun to explore.

Cheers,
Tom

My favorite antenna:
Get metal in the air & TUNE IT !!!

Right now, I have a 10M Jpole 1 1/2" copper 18' High. 1" copper pipe to 2' above grade. running up the side of my house. A Buncha wires running all funny directions w/ 4-3' groundrods (bedrock @ 4').
Well, here's the fun part...
Inductor:
take whatever you got for wire & wrap it around something wide (2"-6"), tap it & Tune it.(40' #8 Cu. bare wrapped around Winnebego table leg)
Capacitor:
BIG variable, motor driven.
Relays:
Many & Large
Tuning:
Buy a MFJ 259 or equivelant or waste all that time you could be on the air

Here's an Idea for people w/ covenants & Deeds:

Aluminum Peak Vent (goes on the peak of roof)
Just run it & split it in the middle, feed & TUNE.
Saw some Bird Proof Peak stuff on TV. It mounts the same as Peak Vent, but has a bunch of spikes to keep the Seagulls off the roof... Maybe the spikes will give resonance where it just wants to be?

Just Gimme a Restricted QTH, I'll get 'em on the air.

One thing to reitterate:
GET one of them Antenna Analyzing gadgets & Just mark the price to saving all that tuning time !!!!! THink about all the antennas you can find w/ one while Mobile or portable.

Dear All,
I want to build a simple FM Transceiver. The RX is no problem but the TX is posing a few headaches, largely due to my lack of knowledge about FM.

I want to use a synthesiser or similar as a VFO. I was intending to use one of the commonly available ones intended for cellular phone type applications. They appear cheap and relatively easy to use. How do I FM modulate a constant frequency from a synthesiser.

Most of these require a VCO to be connected alongside them. Is there anything that I can do by modulating the VCO? or do I put some form of phase modulation in the output of the synthesiser/VCO combo?.

If anybody has any example circuits with a brief note on how they work then I would be extremely grateful.

Regards

Robin

From: AMDX <AMDX@worldnet.att.net>
Message-ID: <01be3f4b$bbecada0$LocalHost@default>
Source record: 74813

Here's the story;

5 turn square loop 30" per side 1/4" soft copper tubing.
38uh, Xl = 445 ohms @ 1.85Mhz Calculated loss R = .43 ohms
Calculated Q = 1040
Wanted to design a transformer to drive a fifty ohm cable and
spectrum analyzer and later radio.
Transformer had to have a very low reflected resistance to preserve Q.
Even with a core A sub L of 20 a 2 to 40 turn transformer lowered the Q
to about 660. (Tried several transformers before moving on)
A pickup loop about 2 inches in diameter was added three inches away from
the main loop. The Q then went down to 540, I bent the pickup loop down to
be more perpendicular (less coupling) and the Q went up to over 700!
I continued tweaking (reducing coupling) until I peaked the Q at 902!
This is probably as high as it will go because of other losses. Including
the
PVC frame, the air capacitor, if the cap had a Q of 7000, that would bring
the Q down from 1040 to 902 (any comments about air cap Q?)

ICOM 2400a dual band mobile.
I got the mod to open the rx and tx on both bands but i need some clarification on a couple items before i do it myself.
The mod instructs me to clip 4 diodes total (2 for 2 meter and 2 for 440)
Then instructs me to install 2 chip diodes, this is where I need to know if theses two chip diodes are for the tx or rx ? If so then i need to know where I can purchase these chip diodes. The mod gives part #s.
Any help would be great.
Thanks

The 3-1000Z is better tube, requires less drive and has less output capacitance, but with 150 watts drive, you can use the 4-1000A alright, for that matter they should interchange anyway, build an amp & try them both! I had 3-1000Z's on 80-10 and 4-1000A's on 160 & 6 in homebrew amps. My new amp uses 4-1000A's because there cheaper! GL de Dick NY1E

When is it illegal to buy/sell ham radio equipement? I'm not agreeing with spamming and continuously posting for sale ads. (my newreader has anything with the words "for sale" and "fs:" filtered out)., but what can the FCC do about selling radio equipement to CB users?

It may be illegal for an un-licensed operator to transmit, but that's really not the seller's responsibility, especially the legal responsibility. I don't have a license yet, but that hasn't stopped me from buying equipement, even from ham radio dealers. In fact, no one has even hinted at asking for my callsign. (I hope I don't actually "look" like a ham :)).

I really don't see how selling to CBer's will make the voice bands any worse than they are now... If it weren't for the digital and experimental modes of amatuer radio, I wouldn't even be here now.

Layout a length of low impedance line 1/4 wavelength long.
Short one end to the groundplane either with a plated-thru-hole or a
wrap-around ground.

It is now a parallel resonance with 0 impedance at the shorted end and
infinite impedance at the open end. Slide a tap up from the shorted end
to match to the impedance you want.

That is true, you will get only odd harmonics with a _square_ wave, but if you make the pulse width smaller you no longer have a square wave and you will (at zero pulse width) get all of the harmonics.

PSK wrote in message <36963D2B.21E278FE@exit109.com>...

There is another method that I think may give better results, and is a much simpler circuit.

Start out with a NN MHz oscillator (NN being a number).

Have a variable frequency oscillator covering the range that you are interested in. This oscillator can be controlled by a mechanically variable capacitor or by a voltage controlled capacitor. In addition you will need another voltage controlled capacitor that has a limited tuning range, perhaps tens of KHz.

Take the output of the variable frequency oscillator and feed it into a D flip flop (sorry, but can't remember which input---my books on this are at home). Feed the NN MHz into the other input of the D flip flop.

Take the Q output of the D flip flop and feed it into a phase detector (as in a phase lock loop). The reference signal for the phase detector will be NN/NN, in other words 1 MHz.

As you tune the main tuning capacitor in the variable oscillator it will go in and out of lock every 1 MHz.

As someone else in this thread pointed out, the Wadley loop was/is used as a 'block converter' or 'band select'. You can either convert a block of frequencies and have a tunable IF, or mix the output of the Wadley loop with a VFO and have a fixed tuned IF. The circuit I just described can be used the same way.

If you want to build an amp which will cover 160-10m and plan to use switched inductance, pick the 3-1000. The 4-1000 has too much interelectrode capacitance to allow hitting 10m with all of the lead length associated with the tank coils. If you plan to use a roller inductor, it makes little difference.

A quarter-wave stub *ought* to be the equivalent of a parallel
resonant tank.

Perhaps your difficulty is in the method you're using to
connect or couple into the "tank".

What have you tried so far and why do you think you always
come up series instead of parallel?

Alternatively, make the line about 1/2 wavelength long and leave the far end open. The line will end up a little shorter than 1/2 wavelength due to fringing at the open end. Of course, you can't tap up on this one like you can the 1/4 wavelength line.

By the way, in both these schemes, you have to take into account the velocity factor of the line. This depends on the material, board thickness, and frequency. Very roughly, it's about 50% for epoxy glass board and 70% for Teflon. So on expoxy glass, a wavelength is about half the distance it is in air.

One other thing to remember is that unlike an LC resonant circuit, these are also resonant at about 3, 5, 7, etc. times their fundamental resonance. This can cause trouble if you're not prepared for it.

Well, at risk of being pulled apart by those with more knowledge than me, here goes....

The VCO is an integral part of the synthesizer. By varying a DC voltage on it's control line, the VCO frequency is moved to lock the loop of the synth. To produce FM (but really, AIUI, it's phase modulation), you can apply an audio voltage to the frequency-determining element of the VCO, which is usually a variable-capacitance diode ('varicap').

A simple view of this is shown on my page about converting a ex-PMR Dymar 2000, which was originally an AM transmitter, for 2 metre FM operation. See "http://www.qsl.net/g8yoa/dymar.htm"
In image1.gif the screened lead carries conditioned audio from the microphone pre-amp, and applies this across the varicap. D202. The control voltage from the synth. is applied across the varicap via R225. This results in the final frequency being phase modulated, easy! If you are multiplying the output of the synth to final-frequency, remember you will not need a great amount of modulation, as this will multiply also.

> Is there anything that I can do by modulating the VCO? or do I put
> some form of phase modulation in the output of the synthesiser/VCO
> combo?

See above! But also, if you are MIXING the output of your synth with another frequency for transmit, then you could modulate (in the same way) the fixed frequency oscillator, to again end up with a final-frequency FM signal. If your fixed frequency oscillator is crystal controlled, try paralleling the trimmer capacitor with a varicap, and treat it the same as above.

> If anybody has any example circuits with a brief note on how they work
> then I would be extremely grateful.

Hope that helps. Let us know how you get on? Is this for 6m FM? If so,
have you considered the RSGB challenge of building / designing a 6m FM
transceiver? Just a thought...

>[stuff deleted]

You'd see the idea of using a type D flip flop as a mixer years ago, but
for some reason you don't see much mention of it in recent years. I can
picture articles that used them, but I'd have to do some searching to dig
them out and so I can't provide info on which pin is fed from what source.

But I think you've complicated something unnecessarily. There was a time
when you'd see PLL's for generating signals every 500kHz or 1Mhz for the
first oscillator in a receiver. I even mentioned one in this thread, when
I mentioned that such a scheme was used in the HRO-500. And you'd see
articles for building such a PLL in the ham magazines.

But they locked to a harmonic of the reference oscillator, without the
need for a mixer between the VCO and the phase detector. You'd tune the
oscillator manually till it was close to lock (often indicated by a beat
note in an audio amplfier fed from the output of the phase comparator),
and then the phase detector would take over. The oscillator would feed

the phase comparator, and the reference oscillator (with plenty of harmonics) would feed the other input. Remember, the simplest phase detectors are harmonic sensitive.

Some of the construction articles mentioned that it was harder to lock the loop the higher the harmonic you were locking to, and also that the lower the reference point the more trouble.

There is nothing particularly different between this and having the VCO go through a programmable divider. One uses harmonics, the other uses division. Functionally, I think there are trade-offs to either scheme.

If you lock to a harmonic, you'll need a dial for the oscillator tuning, and you will be going in and out of lock as you tune through the harmonic points. But since you are manually tuning the oscillator, the voltage variable capacitor does not need to tune very much.

If you use a divider, the VCO should always be in lock, and the number of the division will always tell you the correct frequency. But you'll have to have a VCO that tunes the whole range (though you could use pre-steering off the programmable divider input).

I think the locking to a harmonic of the reference was primarily used because programmable dividers weren't available or were still hard to get. The scheme was used in the HRO-500 and the Galaxy R-530 receiver, perhaps others. One construction article that comes to mind was in QST for January 1972 (with an excerpt in the ARRL Handbook for a nubmer of years). The author had an updated design in Ham Radio about 1978 or so.

Ok to get from PM to FM all that is required is a 6dB per octave filter.
A simple CR circuit will do the job. Put it in the Audio circuit ;-)

The other way is to use a varicap modulated VCO and a mixer to add the
synthesised frequency.

Could you use a differential to single ended amplifier, such as a FET op amp? This could be designed to have a very hi impedance input and a low impedance output.

With lots of gain you could use a resistive network on the output to match to the 50 ohm cable.

I am assuming here that it will be used for receiving only.

>
When I saw the subject header, I thought you were asking about cascading ceramic filters. The idea's been on my mind, I'm sure I mentioned the idea here once. This does give a chance to mention an article about this that I came across. In an old article in 73 (December 1977) about the Yaesu FRG-7, reference is made to an "by Ron Risher VK3OM in the March 1977 issue of "Amateur Radio". He describes... an alternate filter, consisting of four cascaded SFD-455-B solid state filters linked by small coupling capacitors". It might be interesting to someone who can get ahold of the magazine, which I assume is Australian.

As for ceramic resonators as filters, I've not seen much about them. When they were a new item, you'd see them used in the emitters of IF amps, across the biasing resistor. The idea being that they'd replace the bypass capacitor, and provide high gain close to the resonators frequency and dropping off away from there. You'd see the same idea using crystals.

But I've nto seen anything about using ceramic resonators in ladder filters. That doesn't mean it hasn't been done, doesn't mean it can't be done, just that I've never seen anything in the ham magazines about it.

I've yet to build a ladder filter, but the articles that detail creating your own all mention the need to evaluate the crystals used and taylor the coupling capacitors to the crystals. So if I was going to try to use the resonators, I'd try the same techniques to evaluate them. In itself it might be interesting, to see what results you get. The articles warn about low-Q crystals, and perhaps you'll find that the resonators aren't suitable. But until you gather the data from evaluating the resonators, you may not be able to figure out the rest.

As mentioned before, there are three articles about ladder filters at the back of W1FB's Design Notebook. They came out of QST, and there have been other articles ont he subject since then, in QST and Commuications Quarterly and Ham Radio.

Hayward says that narrow band filters are easier to do than wider (ie voice) and that wide band are easier as you go up in frequency. I don't know what that says about ceramic resonators at 455KHz. All the home made ladder filters I've seen described are in the HF range.

The problem with this is that the VCO frequency is not linear with voltage.
This will result in the deviation being different at different frequencies
in the band. Depending on how much of the voltage controlled capacitor
range is actually used this may or may not be a problem.

A better way would be to have a second voltage variable capacitor _very_
lightly couple to the main one, say with a small fixed capacitor in series.
Then this second voltage variable capacitor can have a fixed bias and the
modulation applied.

Another approach, as the previous post says, is to modulate another fixed
oscillator and mix together.

To get true FM you will have to use a preemphasis circuit on the modulating
audio. There are standard circuits for this in the various books on the
subject.

I have had trouble with coupling strip lines together, like in a multi section filter. The stop band always seems to fall apart unless I put a grounded shield in between the sections. The sheild is shorter than the strip line so there is a small amount of coupling between the sections.

Why do they act like this, Roy? I have not seen this in very many of the texts on the subject.

Incedently, if you make the shorted line smaller than a quarter wave it can be tuned to frequency with a small variable capacitor.

Jim,
1) Thanks for this useful addition. Most of the books that I have only
do CW and SSB. What are good ones for FM type circuits and supporting
discussion of them?.

2) What is the form of the pre-emphasis?.

Yes there has been some thought about a high input impedance amp.
I might even have to spoil the Q to get decent audio!

593. Re: Ceramic ladder filter?

Newsgroup: rec.radio.amateur.homebrew

From: nobody@xxx.com
Message-ID: <369E7505.6EA2CFB1@xxx.com>
Source record: 74754

A 2 resonator ladder filter is definitely possible , even with low Q
resonators,
and maybe a 3 resonator filter , if U accept a 10-12dB filter loss for a 3
resonator
filter. (Low Q means greater Loss and Low order of cascading)

A IF amplifier using one BJT like 2n2222a stuck between two 3 resonator
filters
should be usable with about a few db gain and 10 db NF.

Starting values for a 3 resonator filter could be Zi=Zo= 1 to 2 K and Shunt
capacitors for ladder from 330 pF to 500 Pf.

This should be pretty easy to lash up and test .

If I get time time I will try to test it.

Well, as much as I hate to see the same add over and over again, we need to give him a little latitude since he has cut back in the amount of postings and seems to be following reasonable posting practices. Let's pat him on the ass and give him a hearty, "That a boy, you did good".

With that being said, I like the next guy feel that he has as much chance selling the damn thing as a Chinaman has intentions of not including monosodium glutamate in the food they sell us. He knows he's just pissing in the wind, It's simply not going to happen. He will carry the damn thing into the after life and probably try to sell it to Gandhi or Lucifer. Hey what the hell, it sounds about as reasonable as him selling it.

He has a dream (That sounds familiar) that he needs to pursue. He will wake up one day and see that it was nothing more than a waste of his time and ours. At least he will know that we were right.

My current bid stands at $0.32 a pound. I'm being generous since this is far above fair scrap value.

Seems that he's a bar-room philosopher too. It wasn't enough that he's playing (or playing with) the Court Gesture and thinking we're all fools, he really believes that he's doing us a favor by trying to sell us this amp.

My son, it's time for you to purge your ass and drink a pint of magnesium citrate and blow a load and you'll feel better in the morning. The first indications of constipation is when you start believing the shit you spout out your mouth.

It's true that newsgroup discussion of it is useless. But "just hit delete"
is exactly what spammers want you to do, so they can continue to spam
unmolested.

For those interested, the address to complain to is abuse@aol.NET if you're
not on AOL, or tosspam@aol.com if you are using an AOL account.

Hell yes you can make a microstrip parallel tank equivalent !...just
short a quarter-wave microstrip section on one end and drive the other.

In contrast...a series resonant equivalent is the just the opposite..
open on one end and drive the other end of the 1/4 wave line and
it will look like a SHORT at the driven end. This trick is used for
amplifier bypassing since caps can have a series resonant below
the frequency of interest. Frequency-sensitive bypassing of course.

As you might have guessed...the 1/4 wave section acts an impedance
reciprocator....1/2 way around on your Smith chart give the inverse
impedance.

I don't know, unless the lines are too close together. I've got
several pages of notes on the topic from a Les Besser course I took,
but haven't yet actually made a coupled-line filter. I'm sure there
are folks reading this who have experience with these and could answer
your question.

An isolated tuned circuit cannot be unabiguously described as either
series or parallel. It depends on how you couple to it.

If you tag my posting, I will post two (2)
times to give you something to do.
HAVE A BALL - I AM

A young blonde was on vacation in the depths of Louisiana. She wanted a pair of genuine alligator shoes in the worst way, but was very reluctant to pay the high prices the local vendors were asking.

After becoming very frustrated with the "no haggle" attitude of one of the shopkeepers, the blonde shouted, "Maybe I'll just go out and catch my own alligator so I can get a pair of shoes at a reasonable price!"

The shopkeeper said, "By all means, be my guest. Maybe you'll luck out and catch yourself a big one!"

Determined, the blonde turned and headed for the swamps, set on catching herself an alligator.

Later in the day, the shopkeeper is driving home, when he spots the young woman standing waist deep in the water, shotgun in hand. Just then, he sees a huge 9 foot alligator swimming quickly toward her. She takes aim, kills the creature and with a great deal of effort hauls it on to the swamp bank. Laying nearby were several more of the dead creatures.

The shopkeeper watches in amazement. Just then the blonde flips the alligator on it's back, and frustrated, shouts, "Damn, this one isn't wearing any shoes either!"

I have the transmitter for the radiosonde that was used by the US GOVT in the 70's. The number is T-435A for this part. I do not have the battery, but would like to use the transmitter for other things... Does anyone know the voltage for the wires? There is a red, black, White, grey, and orange wire... the voltages in the manual are 110v, 6 v, and 1.5 volts. If anyone could give me a clue as to which ones are which, I would appreciate it!

Depends on the bandwidth you want.
Two terminal Ceramic resonators have significant shunt capacitance so 3
terminal are better, if stages are separated by isolating BJT then
gaussian type response is achieved with good transient response. 3
Terminal crystals (monolithic duals) are available cheaply that will do
the same at 10.7MHZ and above.

DSP unit ?
I'm wondering what processor it uses and whether
is has the code embedded into the processor or
it has an external ROM ?
I was thinking of picking up a used one to
experiment with.
Anyone?

>>
>>Ok to get from PM to FM all that is required is a 6dB per octave filter.
>>A simple CR circuit will do the job. Put it in the Audio circuit ;-)
>>
>Hate to appear thick but how will this do it?.

The instantaneous frequency of FM and PM is given by:

FM f(s) = Cos (wc t + k Integral (f(t)) dt)

PM f(s) = Cos (wc t + k f(t))

respectively.

If you examine the equations you will see that they are very similar.

fc is the frequency of the carrier
wc is the angular frequency 2 PI fc
wc
wc t is the carrier amplitude at an instant in time t
k is the modulation Index
f(t) is the amplitude of the modulating waveform at an instant in time.

The mean frequency over a time period for a PM signal is the carrier
frequency.
i.e. the mean frequency deviation is zero. (thus Doppler can still be
sensibly extracted from a PM signal.)
The angular deviation is less than 2 Pi (360 degrees).
The ideal deviation for best S/N is one Radian. see Weber tests

For an FM signal the mean frequency over a time period is a function of the
applied modulation amplitude and waveform and the carrier frequency.

Upon inspection it can be seen that the difference between the two functions
is the integral of the instantaneous values of the modulating audio
waveform.

A simple integrator can be formed from a resistor and capacitor.
integral (f(t) dt)

This integrator is also described as a 6 dB per octave filter.

By applying this Filter to the modulating waveform before it is impressed upon the Phase Modulating point of the modulator converts the resultant output carrier to a FM signal.

QED

I hope that explains the underlying theory to your satisfaction.

There is life after the RAE ;-)

For Sale:

Fluke 8020A 4 1/2 digit DVM. (still the most accurate handheld they make) Measures AC & DC volts, amps (2 amps max); ohms, frequency (to about 200Khz, I believe), and db.
VG condition, case, leads, no manual. $200 OBO.

Valhalla Scientific 2010 digital power analyzer. Measures volts, amps, power from DC to 40Khz. Always shows true rms watts + either volts or amps. Will handle 300V and 20A max to 6000watts max from DC to 10KHz. (2 amps max from 10Khz-20Khz for 600watts max) Calibration verified Sept 97 by lab. Primarily intended for measuring true rms power usage on AC equipment. Great for finding out what the various things plugged into the wall Really use in the way of power. Have manual and homebrew AC test jig. $600 OBO.

615. Re: 3-1000Z VS 4-1000 ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-15 00:00:00 UTC
From: Dan Newby <newbyd@ipix.com>
Message-ID: <369F7522.16A070CE@ipix.com>
Source record: 74678

I have built several amps over the years, the amp I use now is one I built in 1987. It uses a 4-1000. The 3-1000 is not really a good substitute. It will work when just plugged in, but with reduced efficiency and higher input SWR, if you have built your amp with tuned input and adjusted the tank circuit for the best efficiency. This is the same going the other direction also, from the 3-1000 to the 4-1000. The intrerelectrode capacitances are not the same.
A 4-1000 CAN easily work on 10m with or without a roller inductor. You need to follow good engineering practices, keep all connections that are in tuned circuits to the minimum length possible. The efficiency of my amp ranges from 52% on 10m, to a high of 72% on 40m. Now, the efficiency is less on 10m, because of all the extra stuff in the tank to allow it to work on the other bands, but this is the case with all multiband amps, regardless of the tube used. With less interelectrode capacitance, the 3-1000 may end up with slightly higher efficiency on 10m. But the quality of construction, parts used(especially size), layout, etc., will far outweigh the difference in the two tubes.

> When is it illegal to buy/sell ham radio equipement?

Well, there is the matter of manufacturing for sale more than one each of a type of HF-capable amplifier per year. I believe but am not positive that the particular rule for hams applies to everything below 2 meters. And while the amps J.R. makes look different, whether they ARE different electrically is subject to interpretation by the FCC.

So his buying and selling may be subject to regulation by the same gang he took to lunch last Sunday. Frankly, it's not my problem. The more amps he builds, the more toys there are in the world.

I was also wondering, with a transformer, if the loss in the transformer
would be a major problem since it may be bigger than the radiation
resistance of the loop. An amplifier would overcome this.

I have been considering experimenting with an amplified loop myself, but
have not obtained enough roundtuits.

Hello Fellow Boatanchorites
Have few tubes surplus to my needs. Dee says "we dont need them, sell or trade them off". So here goes...

1- 814 RCA, looks NOS, chks new, $15.
1- 843 RCA, NOS, chks new......$20.
4- 872A GE, w/ orig paperwork, NOS.....$15.ea
4- 4-125A 3RCAs, 1Amperex, NOS.....$40.ea
7- 8008 RCA pulls from TV tx in orig boxes...$35 for all
"many" 6080s US tung. & others, NOS......$3.ea
3- 4CX300 Jan/ Eimac, NOS, orig boxes.....$50.ea
"many" 6BG6, G, GC all US made, NOS......$4.ea
1- 4CX250B Svetlana, NIB w/ fact warr, ...$80.
6- 6GJ5 RCA, Sylv, GE, NOS, Dee uses these in his T4XC with no modif, just plug & play w/ full output+, lots less money, $10.pr
1- 4-65/8165 US made, lo hrs pull, chk good.....$20.
2- 6528 Chatham/ Jan, NOS, same as 6336A but higher gm, carbon plts.....$60.pr
1- 8643/A02 Amperex, NOS, VHF dual tet. like 5894, 60w, 7.25v fil.....$10.

All the above + shipping/ packing. We take Visa / MC in fact we prefer this to method of pmt.

That's an interesting thought, and not one I've encountered before. A parallel LC will of course have a very high Z at one frequency and lower Z at others (when measured directly across the parallel combination), and a series LC circuit a very low Z at one frequency and high Z at others (when measured directly across the series combination). So how would I couple to a parallel LC to give the characteristics of a series LC, i.e., low Z at resonance and higher Z at other frequencies, or to a series LC to get a high Z at resonance?

You would modulate a varactor that is lightly coupled
in parallel to the tuned circuit of a VCO.
Add some RF amplification...voila' ...FM TX !
The modulator/amplifier should have some limiting along the
way to prevent overdeviation.

It could be that the coupling is wrong or maybe your topology is such that
resonator #1 couples directly to resonator #3, etc. For instance, arranging
1/4 wave resonators in an interdigital pattern gives a more symmetrical
stopband performance compared to a combline pattern (all grounds at
one end). If you're using 1/2 wave resonators you spread them out in a line.

Zverev gives filter design information in terms of the coupling between
resonators. You can empirically generate curves of the coupling vs.
spacing using 2 of your resonators with a few iterations.

Sounds cool!

I had already done something similar to run very low power FM radio commercials on a lot of different channels simultaneously, like house for sale, open house, etc...where someone driving by would hear it and maybe stop in, but I couldn't cover every frequency, just every other one!

Thanks again,

Dennis

No, but I'm kind of slow that way. I'm sure it made more sense to the other readers. I'm afraid I'll just plod along with my "in the box" thinking. Thanks for the explanation.

If you draw an L and C connected together as a circuit, you can see that
they are in series and in parallel simultaneously. What appears to
happen at resonance (neglecting the uncertainty about what the
'resonance' frequency is if the Q is low) depends entirely on how you
couple the energy in, and how you couple it out. For example, at
resonance, the voltage across either reactive component is a maximum -
so that's a parallel resonance, isn't it? But the current through either
component is *also* a maximum - so that's series resonance, isn't it?

In impedance terms, it's high at resonance if you look *across* the
circuit, but *low* at resonance if you break it open and look in series
with it. But you must look across with a high impedance 'looker' and
look in series with a low-impedance 'looker', otherwise you ruin the Q.

A young blonde was on vacation in the depths of Louisiana. She wanted a pair of genuine alligator shoes in the worst way, but was very reluctant to pay the high prices the local vendors were asking.

After becoming very frustrated with the "no haggle" attitude of one of the shopkeepers, the blonde shouted, "Maybe I'll just go out and catch my own alligator so I can get a pair of shoes at a reasonable price!"

The shopkeeper said, "By all means, be my guest. Maybe you'll luck out and catch yourself a big one!"

Determined, the blonde turned and headed for the swamps, set on catching herself an alligator.

Later in the day, the shopkeeper is driving home, when he spots the young woman standing waist deep in the water, shotgun in hand. Just then, he sees a huge 9 foot alligator swimming quickly toward her. She takes aim, kills the creature and with a great deal of effort hauls it on to the swamp bank. Laying nearby were several more of the dead creatures.

The shopkeeper watches in amazement. Just then the blonde flips the alligator on it's back, and frustrated, shouts, "Damn, this one isn't wearing any shoes either!"

Robin,

Look at the following URL:

http://www.legend.co.uk/~veronica/a-access.htm

This firm makes FM transmitters, including STEREO units.

I bought their 50mW stereo unit to serve as a sig gen for
measuring the frequency response of hi-fi stereo tuners.

I bought a ready made unit - it only cost about ten quid more than the
kit. You'll prabably find they ill sell you what you need
cheaper than you could make it.

Cheers,
Martin

Message-ID: <36A12C66.44456D1F@buffnet.net>
Source record: 74620

I have two high voltage transformers for sale /trade
They were both used in 4-1000 amps.

One is a HAMMOND Transformer
14" long x 8" wide and 9 1/2" high
This one has taps at 1000,2000,3000 volts
This is one heavy SOB and must be picked up.

The second transformer is a STANCOR
12" long x 11" wide and 10" high
taps at 2000 and 2500 volts
Another heavy SOB , Pick up only

The Stancor is mounted in a very nice Hammond cabinet that is gray and
is 20" wide x 13" high and 16 1/2" deep, handles on end.

Also included with it is three 5kv oil caps and a voltage doubler diode
stack. You have to supply the front relay rack panel and metering.
Power cord and millen high voltage jacks on the back.

I would trade the stancor power supply for a 1500pf 1-3kv vacuum
variable or some 4-1000 good pulls.

If you are weak; don't come alone :-) These are some of the heaviest
transformers that I have seen in a while. They must have been in some
kind of broadcast transmitter.

Let's compare notes. What kind of transistors do you keep on hand, and why? Since I'm just starting to experiment a bit (after many years of ignoring it), I'm tending to build up a few general-purpose things like 2N2222, 2N3904, 2N3906, a few MPF102 and J-310, and the odd power TO-220. What's your favorite, indispensable, wouldn't-do-without-it type? What do you have dozens of, never used and wish you'd never spent the money? What other types of discrete semiconductors do you keep around? (For me, a few 1N4001, 1N4007 and 1N4148 is just about it.)

You've selected my favorites already. I'd add to that list the VN-10 VMOS FET (TO-92). Those dang things really come in handy. (I'm a little out of date -- there might be better ones more readily available today.) There's also a complimentary VP-10, but I don't find nearly as much use for 'em. A TO-220 (both NPN and PNP) with low saturation voltage comes in handy, too, on a number of occasions, but I don't have a particular favorite.

644. FS: NOS Clarostat wirewnd. pwr. resistors

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-16 00:00:00 UTC
From: Brad Thompson <Brad_Thompson@pop.valley.net>
Message-ID: <36A142CB.7898@pop.valley.net>
Source record: 74625

Hello--

I'm offering the following NOS Clarostat wirewound power
resistors for sale at $3.00 each plus postage. All are rated at
50 watts maximum (but see note below re: adjustables).

You can use these as power-supply bleeders, voltage dividers, tapped
plate loads, etc. All are manufactured by Clarostat and are
individually boxed; mounting hardware is not included.

73,
Brad AA1IP

****

Clarostat p/n Qty. Avail. Resistance Type
------------ ---------- ---------- ----

VP50K 2 30K Fixed
VP50KA 9 35K Adjustable
VP50KA 6 40K Adjustable
VP50KA 1 50K Adjustable
VP50KA 4 60K Adjustable
VP50K 6 75K Fixed
VP50KA 3 80K Adjustable

****

NOTE: power rating for adjustable resistors applies to entire resistance
element. If you use 25 per cent of the resistor, power dissipation
in that portion derates to 25 per cent of 50 watts, or 12.5 watts.

U.S. Postage: $4.75 for one to ten pieces; $5.75 for 11 or more pieces;
foreign purchasers; inquire for postage.

I accept payment via personal or cashier's check or money order drawn in
U.S. dollars and made payable to "Brad Thompson".

Warranty policy:

If you purchase these components and find them unsatisfactory upon your
inspection, you can return them within seven days in as-received
condition for a full refund or replacement (if available).

This material is subject to prior sale and is supplied as-is, as
new-old-stock (NOS) merchandise, with all responsibility for safe and
successful application residing solely with the purchaser.

Roy, I think the point was that a Series tuned circuit and a Parallel
tuned circuit are exactly the same thing, just redrawn.

The trick is how you couple into the circuit.

If you break the "series" circuit, you have a low impedance point,
while if you go "across" the L (or the C, same thing) you get high
impedance.

If you "tap" the L or the C you can get any intermediate impedance.

Or to put it another way, at resonance, a Tuned Circuit has
large circulating currents (which implies low impedance)
and at the same time, high voltages (which implies high impedance).

It depends where you measure it.

A strip line is no different, just harder to visualise.
It still has current and voltage nodes.

Make any sense ? ..... Zim

>thinking. Thanks for the explanation.

Well try this......

Connect three resistors in series with each other so they form a ring.

No question about it, they are in series.

Now connect two resistors in series the same way.

It still forms a ring, alhough smaller.

But is it in parallel or in series ?

In is of course, both a parallel and a series circuit.

At the same time.......

It depends how you look at it.

Cheers .... Zim VK3GJZ

Did not see the original post, so I didn't know how serious the question
was.
It is some very good reasons for discussing FM methods, because some
different systems exists all over the world, one may experience some
problems communicating with different sets.

While it is normal to have 6dB pre-amphasis, some commercial rigs have
not, and some have 6dB pre-emphasis ahead of speech-clipper but very
hard de-emphasis after it .
Some have no audio pre-emphasis, but have DE-EMPHASIS after the
compressor and use phase-modulator (Shinwa). Removing the modulator
de-emphasis (and decrease audio gain) make this set compatible with
normal sets - at least for packet radio. On RX side Shinwa has another
de-emphasis, this is rather strange practice!

etc

Some of us remember those TS-700 where adding pre-emphasis to TX made
substantial quality improvement (adding a 50-100nF capacitor in series
with mike element)

I am only an amateur circuit designer. My wife and I are using CB's around town and invariably we end up turning the squelch up and can't call each other and the feds won't allow upping the power.

sooo... we are thinking of using a tone generator and decoder and using the output to turn the speaker off and on. that way we could leave the radios on all the time at low squelch until the radio receives the tone and then the speaker would turn on, like a phone ringing.

Am I forging new ground here or do such things exist?

Any circuit diagrams for my son and I to build?

It's something like the 8620C sweeper. The band switch controls a
revolving drum which brings different range scales into the visible
window on the front panel and the tuning knob moves a pointer by
string, like an old radio set, horizonally across the scale markings.

653. HELP! Paralleling 2 switching supplies

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-16 00:00:00 UTC
From: Piet Ibelings <nntp@ibelings.com>
Message-ID: <77qgt7$1q8$1@camel18.mindspring.com>
Source record: 74705

Hi,

I have 2 Lambda LFS-48-48 power supplies. These are 22.5Amps at 50Volts each. I need 45 amps to power a homebrew amplifier. What would be the best way to combine these puppies? Do I need a little of resistance or would a diode on each B+ do the trick. If the voltages are within .2V would I get the full current of 22.5x2amps?

This is what i'm powering:

http://www.ibelings.com/n4ip/mrf157.html

Cross-posted to:
rec.radio.amateur.boatanchors,rec.radio.swap,alt.drugs.mushrooms,alt.drugs.usenet,rec.radio.amateur.homebrew

Been about 3 months so time for a wanted list again.....

1) Altec Bookshelf speaker. I post a lot looking for this
http://www.atl.org/images/altec.jpg
Not having much luck in a years looking so will be pretty
generous for one in good shape.

2) Funky looking home built microphones for less than $1 plus postage.
I'm probably the only guy in the world who would spend good $
for something that looks like the one sitting on the Vibroplex box
http://www.atl.org/images/bestHBmic.jpg
The Wollensak on the hand turned base is nifty but that pure junkbox
with the button glommed from a (pay?)phone takes the cake for
scratch built with character (so far)

3) Older National RX like FB-7 or other small pre-war RX with plug
in coils. Prefer something that is challenging and cheap. Perhaps
someone in their misguided youth disassembled and still has the box
of parts???? Your secret will be safe with me!

4) Homebrew tube type receivers that never worked or weren't completed
or have been abandoned for new and better things.

I'm told I have weird taste in radio debris so prior to tossing anything
out, send me some mail describing it. Who knows, I might swap something
you'd really like for something you were gonna toss. That Vibroplex
under the funky microphone above is sn 174276 and a Champion in it's
matching box. Box has been opened but is in pretty good shape. Key has
had minimal use. Might swap it for something...maybe a more unusual key
in poorer condition or ???

Thanks for reading.

Would one of you very kind, technical people please explain to me a mixer for AM. I read that the mixer has to be non-linear to be effective. What does this mean? They say that a diode is nonlinear and can be used, however a transistor (properly biased) is also nonlinear and has the added feature of gain. What would a linear mixer produce? Is there a different list where I can get answers to technical questions such as this? Or have I found the right place?

Thanks, Don Salo

> Thanks, Don Salo

If the mixer is linear, then the output is an exact replica of the input. Put in two signals, the received signal plus the local oscillator, and you get out two signals, the received signal and the local oscillator. There was no interaction. The output may be smaller or greater than the input, but no crossproducts are generated. An audio combiner is unfortunately called a mixer. It is a linear mixer.

If the mixer is non-linear, the two signals interact. One signal affects how the circuit responds to the other. The gain for one signal is determined by the instananeous level of the other signal. The result is a multiplication of one signal by the other. Because of the multiplication process, a non-linear mixer is often called a product detector. The output, math omitted (there might be children reading this), consists of the original frequencies, the sum of the frequencies and the difference between the frequencies. Filters are used following the mixer to select the desired frequencies and/or reject the undesired ones.

Does this help?

John

I'm rebuilding one that is in great shape but needs an overhaul, grease dried up etc. I have no controller for it but intend to build one since the original was just a powersupply and an a meter for direction feedback.

Anyone know the voltages required for the motor, I think it's 90VDC but not sure.

What we're talking about here is paralleling 2 power supplies - the type doesn't matter. I have a couple of Condor 27.5V 10A linear supplies paralleled, with a power diode in the DC output of each one. The voltage sense connection is made before the diode. Seems to work OK.

The system doesn't have a crowbar, uses an (aircraft-type) over-voltage trip relay in the combined output.

Wanted, anyone who commutes / travels between UK and Germany
on something like a regular basis by car, van or lorry that can help with
transport / delivery of a couple of items of radio gear. I'm trying to save
the
buyer some money on shipping costs and risk of damage, there will of course
be a modest cash incentive. I don't have the address in Germany yet, were
still negotiating on the items. I'm in Somerset but could meet and pass on
the items and I'm sure the guy in Germany would travel to meet whoever
wherever.

Anybody GENUINELY interested in helping ?

Message-ID: <36A20DEE.12469D3C@buffnet.net>
Source record: 74636
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.swap,rec.radio.amateur.equipment

I have some heath junk that was from a heathkit amplifier.

A set of three large knob and one smaller knobs. The larger knobs are about 2 1/4" diameter and the smaller one is 1 1/8" diameter. These are the dark green jobs that have a brushed aluminum rim and aluminum center inserts. The have a small triangular pionter on the outer rim. These are in exceptional shape and would make nice replacements for someone with crappy knobs.

The second griefkit item is the tuned input from the amp. It consists of a ceramic rotary switch silver mica caps and slug tuned coils for the five bands all mounted on a L-shaped aluminum bracket. Also in excellent shape.

The third item is a pair of meters. They each have the following labeling. (the same on both meters)

Final Plate MA, Grid MA and OUTPUT.
The scales are 0-500, 0-10 and 0-10
--

If these items are of use to you. Make an offer.
I would prefer to sell the bunch instead of three or four packages to the post office.

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.swap,rec.radio.amateur.equipment

I have two roller inductors that can be used in amplifiers or tuners.

I picked up Johnson Matchbox and wont be building a tuner so I have the

following if anyone is interested.

They are almost identical except for the length. The endplates and

materials are the same.

One is marked Cardwell 229-203 around 37 turns total length 7 1/4"

The second one around 27 turns and total length 6 1/4"

Most probably 28 and 18 uH according to an old RadioKit catalog--

I have duodial turns counters if you need them.

Make an offer on one or all. If you give me your zipcode I can guess the
shipping charge.

I need high voltage filter caps and a vac variable if you have them to
trade.

I'm looking at doing the same thing. I guess that competition announced
at XMAS has sparked a few thoughts off. A useful source is the Philips
Radio Products databook. Farnells sell them for 13.50 or if you can
scrounge on all the better. There is a section on Synth chips that will
do exactly what you want. They only need coupling up to a VCO and ref
osc and off you go.

Unfortunately these all need some form of programming as they all work
by a serial line but using something cheap and cheerful to do this, like
a small pic, shouldn't be too difficult. you could jury rig something
with TTL and a set of shift registers if you wanted to get up and going
ASAP though.

Cheers

Robin

PS: Good luck with building it. Its going to take me a few months to
get myself sorted out before putting a prototype together.

Hi.

Been preparing to upgrade the station with some computer control. Part of this is to control my Yaesu G-800-SDX rotor via my contest software. Yaesu wants $300 for the interface! That's almost as much as the rotor was when I purchased it.

So... anyone in hamland come up with or can guide me to a homebrew interface to control the Yaesu rotors? Sounds like a good project for the electronically able, unlike me.

Please respond directly (also to the group, if you want).

Hi

have now scanned to gif file AGC modifications showing to improve the rather poor ssb quality on this receiver to be the best receiver I have ever listened to. It is only 8kb as gif file, so if you wish to see it, pse send me an email
Note: I cannot exactly tell how I did it, but believe the drawing is showing how it was done as far as I can remember it

Also available gif files for FT-902 CW keying modification and block diagram for low-signal units with some improvements and signal levels

The roof of my Saturn station wagon is plastic. I had earlier checked the sedans and their roofs were metal, so when I tried my mag-mount and it would not stick, I was surprised. The only piece of metal big enough for a mag mount is the hood, so I put it there. Even though Im only using 0.5 / 5 watts, Im still unconfortable about the antennea lobes being in the plane of my eye. (Yeah, I use a speaker mike with my handheld to keep the antennea a little further away.)

I have a pro 2006 realistic 400 channel scanner for sale.
It currently has no mods done <but can if needed>
There is a few scuffs on top that would make it a 8.5 of 10.
This radio works perfectly.
I want $250 + shipping
will trade for kam + with version 8.x hardware or
or I will do a partial trade for:
6 meter allmode yaesu or the like
would consider ts660, triband radio as long as
allmode for partial trade
kevin
km5rt@ticnet.com

I also have several 4x150 tubes for sale/trade

Roy / Jim,

there is a nice DOS/WIN shareware program named Faisyn which calculates (beside "standard" filters with lumped elements) distributed stepped impedance resonator filters and distributed parallel coupled line filters.

I'm still looking for formulas to calculate magnetically coupled bandpass filters using microstrip lines instead of lumped inductors. I didn't find a way to simulate this type of filters with Puff and so I have to use the trial and error method which is a bit time consuming. Any ideas?

Regrettably, I ran out of steam after that. I had hoped to create an expanded (with negative resistances for oscillator design) and compressed version, but it got too weird and asymmetrical.

At any rate, Spehro Pefhany used Adobe's Distiller to create a PDF file of the Smith chart, which you can find on

http://www.qis.net/~josemj1

There's a spiffed-up version of my PS Smith chart stuff there, too, courtesy of Rob Castle.

Interestingly, I recently ran across a version of mine in which the text was translated by Lasse Langwadt Christensen to Danish. I was really pleased to realize that it could be modified so easily to accomodate a different language. You can find it with a search at http://www.dejanews.com .

This sounds like a very slick approach. I'm sure DSP would yield great results, but I don't have any DSP programming background, and something tells me this would not be a trivial project.

I was thinking of some sort of quick and dirty 1-2 IC approach, operating at the IF freq, using filters of some sort.

If you elect to press on with this, please post to the list how it comes out. A few folks have replied to me RE a simpler approach, and I'll do the same on my end.

I've got a couple of home built wooden workbenches that I'm using for electronics assembly and light duty mechanical tasks.

The work surface is 1/2 inch plywood with a top layer of medium density fiberboard. I've been planning on applying a few coats of polyurethane to seal the fiberboard, when it occurred to me that there might be a static dissipative finish I could apply.

I've seen static dissipative floor polishes, but I was thinking of a permanent coating.

Does anyone know of any finish that is static dissipative, which I could apply to MDF or plywood?

Is there a way of treating polyurethane so that it becomes slightly conductive? I.e. mix in a certain amount of graphite, or some other conductive material? What about dusting the top layer with graphite while the polyurethane is still wet?

thanks in advance, and 73

What about one of those bike generators? The one I have is an alternator and not a generator. It has permanent magnets for the field. This should produce enough power for an HT. They light a 10 or 15 watt bulb on a bike. The units are small also. Some sort of regulation would be necessary.

> But you'd need a battery to excite the field of most auto alternators.
>

While there are autos that can usefully charge their batteries at 600 RPM,
this is engine speed, not alternator speed. The alternator is running 2 or
3 times faster, more like 1500 RPM, because of the pulley ratios.

For battery charging from a hand- or leg-powered contraption, I'd use a
permanent-magnet DC motor. There are low-rpm "servo motors" available
that are pretty efficient when used as generators. The large number of
poles on the commutator ensures pretty clean DC (less filtering needed),
and the low speed means less loss in step-up gearing.

You dont have to USE DSP, if you dont want to.

Simple OPAMP gyrator filters should provide enough selectivity at 15 KHZ
and you can get away with 1 or 2 Ne602 + 1-2 quad opamps
or
you might want to build a low cost R2 like I-Q (to get opposite sideband
rejection)receiver and get all the selectivity at audio with L-C or opamp
lowpass filters. (This might be preferable)

The TenTec Rx320 use a low IF of around 12 Khz and opamp filters
+ DSP filters. Its DSP filters really are great0 and beat my Collins R390a
mechanical filters.(Less ringing and sharper skirts)

Best of luck with your filters + 455 Khz approach, It would work and would be
somewhat simpler, but hardly something very exciting.

I would definitly try to do something like the R2 Receiver using Ne602 at 455
Khz
instead, as, all the filtering can be done at audio, and DSP interface is easy.

Anyway, I definitely want to learn DSP processing, so will ultimately
use this approach, but in simple easy to build and debug steps.

The current stage is that I just got my R-2 (regular R2 receiver using SRA-1)
up in the 20M band, but am having trouble with excessive oscilator radiation.
Opposite sideband rejection is good and is atleast 40 db or so. Did build
a 1 transistor + 2 diode AGC circuit for R2 to save my ears though.

regards

I'm not sure what books you are refering to, _Gary_ ;-) , but the original idea was developed by a guy named Weaver. If you have access to a good college level technical library you could look them up. If you can have access to a good on line reference you could look up the articles and any _decent_ library would be able to get you a copy for a modest fee, no matter where they are located. I have done this at our local library (city population 60,000) with about 60% success rate.

I have done some modest research into this idea my self.

The basic idea is to have two circuit paths. One using 'inphase' oscillators and the other 'quadrature' oscillators. Inphase and quadrature are also known as sine and cosine or 0 and 90 degrees phase shift.

Each path consists of: mixer---filter---mixer---filter
* *
* *
osc1 osc2
* *
90 90
deg shift deg shift
* *
mixer---filter---mixer---filter

There is a splitter at the input to feed the two paths and a adder at the output to combine the two.

Sometimes the first mixer (on transmit) or second (on receive) are replaced with audio phase shifters, but mixers allow better control of the balance.

Balance between the two paths are critical to performance, as well is the exact 90 degree shift. By doing various 'tricks' related to the oscillator frequencies and filter frequencies different effects can be obtained, like variable bandwidth filtering, passband tuning, etc. It is also possible to demodulate FM.

I hope this wasn't too confusing. By the way, there were article in QST a year of two ago on building practical versions of this.

Not necessarily. In a 'conventional' parallel arrangement, in which the signal source is in parallel with the L and C, the L is a short circuit at DC and the capacitor is a short circuit at infinitely high frequencies. At these frequencies the current will be maximum.

In a conventional series resonant arrangement the source is in parallel with a series connected L and C. At resonance the current will then be maximum thru both.

I challenge all on this newsgroup to show me the difference between series and parallel tuned with out hooking up a signal generator in one of these arrangements!!!

But the point about stubs is that you *can* treat them as if they were
LC circuits. A 1/4-wave stub shorted at one end looks like a parallel-
tuned circuit at the open end. An open-ended 1/4-wave stub looks like a
series-tuned circuit at the other end.

I think I've finally seen your way at looking at this. I define series and parallel cicuits just the way you have here. Both are two-terminal devices. There is no difference between an open-circuited parallel circuit and a short-circuited series circuit, where you're talking about opening or shorting those two terminals, and I assume that's what you mean when you say the two circuits are the same. But I can easily tell the difference between an open-circuited series LC and an open-circuited parallel LC without a direct connection, simply by coupling to the inductor with a small coil and observing the way the impedance of the coil changes with frequency. The same can be done to distinguish a short-circuited parallel circuit from a short-circuited series circuit.

But I'm sure we all know this anyway, and the discussion is solely one of semantics. This is taking on the characteristics of one of those high-Q threads (which rings for a long, long time after being struck) that don't leave the participants any more knowledgeable at the end than at the start. So with this I respectfully bow out.

These bike generators are simply amazing! Some of the units made in
Europe with permanent magnets will put out five or so watts without any
effort whatever---certainly enough to light a small bulb. They appear to
be current limited, so I would think easy to attach to a battery. K7RR

For some time, this was widely used for campus broadcasting stations, in the AM broadcast band. Usually, a few watts (as much as 40 for large buildings) would be coupled into the line on the 120V side of the feed transformer, by feeding all three phases against ground through a capacitor & impedance transformer. It does NOT get across the feed transformer (at least not much), but on the near side it is fairly effective at LF.

I don't know anyone who's tried it for receiving, but suspect it would be too noise-ridden to be usable.

Carrier Current Broadcast Stations couple to the power lines for transmission all the time. During WW-11 when "on the air" ham radio was banned many used "Carrier current" transmissions. The stopping point is the distrubition transformer as the capacity to ground shunts the RF signal to ground. Sparks W4EAS

Just like any random wire, you can try it (taking appropriate precautions) and it may or may not suit your needs. Personally, string a little bit of any type of wire (or even bits hooked together), almost anywhere, and you would probably do just as well. At one time I had about 50 feet of bell wire in a plan helix under a living room rug which worked well for me. And don't forget the proverbial bedspring!

This seems to me to be pointless pedantry. You have put a (presumably)
low-impedance source in parallel with the tuned circuit and then find no
*local * maximum of current in the reactive elements at any finite
frequency? What is the Q of the circuit with the source connected? To
see the resonance, you have to make your source a *current* source (high
impedance). The current at resonance *through both L and C* is then Q
times the input current. That ias why the voltage across them is high.
>

711. Question re TDA7000 and/or other FM receiver ICs

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-18 00:00:00 UTC
From: pmbail01@spamtrampling-moocow.slug.louisville.edu
Message-ID: <A182436CA6876BA5.AD633AD8F76D1D90.0EAFCF3B0B3768D1@library-proxy.airnews.net>
Source record: 74649

Been doing quite a bit of searching on the Internet to find info, have had rather a fruitless time at it, so now I'm asking:

1) Does anyone know of a source where I can possibly get a TDA7000 IC for less than fifteen dollars US? :) (I have found all of *two* suppliers in the United States, and neither of them will sell in lots of less than twenty. I only want two or three, not *twenty*. :)

I would *strongly* prefer a United States-based seller; buying from overseas is not exactly an option, thanks to costs to convert currency and buy an International Money Order in Irish pounds, pounds Sterling, or Euros [not to mention shipping, not to mention the real possibility THEY don't sell in lots of less than twenty, either].

2) If nobody knows of a source in the US, are there any other FM IC's of that rough type (i.e. essentially FM radios on a chip) that are a) fairly cheap and b) one CAN get them without buying in lots of 25 or more through usual electronics suppliers (Mouser, etc.)?

Just FWIW, it would be a major plus if it could either go below the broadcast FM band or above (or both).

3) This last one is a *major* shot in the dark, but does anyone know if equivalents exist for the old TDA1071 chip?

Thanks in advance...

-moo

713. hand cranked generator???

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-18 00:00:00 UTC
From: Jim Pierpoint <pierpo@bellsouth.net>
Message-ID: <36A2C164.4F90@bellsouth.net>
Source record: 74651

Hi Guys :

Just wondering if I could easily make a hand cranked generator to power my HT... just for survival reasons. Is there any reason I could not use an old 12vdc auto generator... put a hand crank on it... and generate enough power for my HT???

If anyone knows a way to do this, or any other way to easily build a homebrew generator that runs at 12 volts and is capable of 5 to 20 watts output, I would like to hear about it.

Thanks in advance...

Jim Pierpoint

> 2N2222, 2N3904, 2N3906, a few MPF102 and J-310, and the odd power TO-220. (clip)

My list is long but a few stand out :) The 2N4401 and 2N4403 are dirt cheap but have superlative performance. They both have excellent noise performance for low impedance sources, great saturation characteristics (including a zero temp-co saturation voltage with the right base current!), good gain and f-sub-t, and can handle 600 mA. The MPS A-18 is also on my short list due to its very high gain, even at very low collector current. The U310 JFET is great for grounded-gate circuits since the case is connected to the gate. I'll stop here!

715. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.homebrew

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, WH6U, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your

article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Cross-posted to: rec.radio.amateur.homebrew,uk.radio.amateur

I have been thinking of building a
LOW IF amplifier with a IF about 10-15 KHZ
which would be run from the AM 455 IF you have mentioned.

This would provide the narrow band width SSB and CW
characteristics + should be a ideal platform for connecting a
DSP kit like the SHARC ADSP21061 or Motorola DSP56307.

The conversion from 455 Khz to 15 Khz could be done with
a 1 or TWO (I- Q) NE602 chips .

The 15 KHz IF filter and demodulator can be realised with either
OPAMPS (GYRATORS for filters, Opamp All Pass Hilbert transformers etc)

Alternately, a powerful DSP like DSP 56307 can implement all of the
15 Khz processing in Software.

No Hi Inductance coils should be necessary as , the Gyrator
circuit is said to be suitable for use in HiQ filters.

At that power level, you're within safety limits. Of course the antenna would work better mounted on a metal roof (preferably via a thru-hole mount), but if the hood is the best you can do, it will suffice, and be safe in terms of RF exposure. (Whether it would be safe in terms of a flying projectile in case of a collision is another matter. I'd feel better with a permanently mounted antenna that couldn't become a heavy magnetic missile in a crash.)

I doubt you're up to hand cranking an auto generator at the required
speed. Unlike alternators, you have to spin up a generator pretty good
to get any reasonable amount of power from it. You'd do better with an
alternator. They produce good power at speeds as low as 600 RPM.
But you'd need a battery to excite the field of most auto alternators.

>If anyone knows a way to do this, or any other way to easily build a
>homebrew generator that runs at 12 volts and is capable of 5 to 20 watts
>output, I would like to hear about it.

There are alternators which use permanent magnets. These can operate
without battery excitation. Some of these are fairly small, so you might be
able to hand crank them through a gearing arrangement. I suspect you'd
want to rig up a way to *pedal* the alternator, however, since your legs are
likely to be able to keep up the motion longer than your arms can.

I know a fellow who coupled an alternator from some sort of garden tractor
to a weedwacker engine. That produced about 30 amps, was small, and very
noisy. He used it to recharge batteries. The advantage was that he could carry
it with one hand to the battery's location. That was useful for starting cars
which had discharged batteries. You wouldn't want to run it to power a
radio, but you could use it periodically to recharge a battery which was used
to run a radio.

All of the European "hobbyist" suppliers will sell in onesies and
twosies. I've bought TDA7000s from Mainline, and TDA7010Ts (the SMD
version) from RS Components.

Credit cards are really handy for this, since credit card currency
conversion charges tend to be much less than what it costs to buy
a money order. And with the cost of long-distance these days, you
can usually phone them and tell them what you want for less than
the cost of an overseas stamp. Set your alarm and take advantage of
the cheap wee hours of the morning rates. Which aren't the wee hours
of the morning *there*...

Guys, Guys! C'mon! 8-)

Roy wants to simulate a parallel-resonant structure which is coupled to the source in the same way a microstrip is coupled: directly. It is not helpful to ask Roy what manner of coupling is being used; that choice has already been made for him.

Microstrip stubs are just transmission line stubs and will behave similarly. If you "look into" a 1/4-wave stub, it appears to be a low impedance, similar to how a series-LC network looks with the other end connected to ground. If you look into a 1/2-wave stub, it appears to be a high impedance, similar to how a parallel-LC network looks with the other end connected to ground.

What sets stubs apart from LC circuits is that they will resonate at higher frequencies, too. Specifically, the stub's impedance will be minimum when the stub's is 1/4 wavelength long, 3/4, 5/4, etc., and maximum when the stub is 1/2 wavelength long, 1, 3/2, 2, etc.

Of course, it's easier to see this by keeping the stub length the same and varying the frequency of observation. The impedance minima will then correspond to (say) fc, 3fc, 5fc..., and the maxima will correspond to 2fc, 4fc, 6fc....

> If you draw an L and C connected together as a circuit, you can see that
> they are in series and in parallel simultaneously. What appears to

> resonance, the voltage across either reactive component is a maximum -
> so that's a parallel resonance, isn't it? But the current through either
> component is *also* a maximum - so that's series resonance, isn't it?

I don't think this argument helps illuminate what is essentially a
distributed-reactance (i.e., transmission-line) problem. It's not
possible to analyze the microstrip from that point of view. Roy's
dealing with waves and fields, not with lumped elements.

I don't wish to step on toes (a futile wish, I know), but I've been in
the same place as Roy and felt obliged to speak up.

How about just putting a bike with generator on an exercise stand. Cranking
with your legs would beat the heck out of doing it with your arms and all the
gearing is already taken care of.

731. CUSHCRAFT ANTENNA SUPPORT

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-19 00:00:00 UTC
From: kovar <kovar@ia.net>
Message-ID: <01be42e4$c56415c0$35d0a0cd@kovar.inav.net>
Source record: 74542

Responses and concerns of others with opinions to Cushcraft products
and customer support follow.

You can only turn your underwear inside out so many times before
something needs a change!
k0var

_ ---
My antenna was damaged in a storm two weeks after I bought it!: After Two
years of attempting to get Capacitors to fix my antenna Cushcraft has
decided not to sell parts for the ARX270N.
: Cushcraft stated they will not let their own employees
: repair them nor will they sell me or anyone small parts for it.
: They will only sell me the three sections at $160 to $190 each.
: OK !, the antenna now cost $$250 new, or they offered to replace three
: sections for $540. Let me put a pencil to this!! Darn! can't be!
: The Six capacitors will now cost me $540 to fix my antenna.
: I remember someone selling the Government toilet seats for about the same
: inflated price !
: Does anyone see the toilet seat relationship ????????
: : Now everytime I sit on a toilet seat Cushcraft will surface, in my
: thoughts.
: Anyone have any busted up ARX270's that would be willing to sell me
: some of those Capacitors?
: I am willing to throw in the kitchen sink and a toilet seat to make it
: worth: your time!!
: :-)
: Jack Kovar
: k0var
: Iowa

Dear O.M.
Thanks for warning me about cushcraft. I guess I won't be buying that
duo band antenna for the home qth.
Vry 73,
Eddie, K4MAS

HEY DUDE! I had an expirience with the Cushcraft "quality" .
I owned a AR-270 dual band for two years. I question the "db" figure
that they give, but upon inspecting it, I spotted corrosion inside the
aluminum base assembly. I couldn't remove the 3 ground plane elements!
I replaced it with the Larson BSA-270 dual band base antenna.
Same size & shape, but I doubled my UHF range!!!!!
The SWR was good on both antennas, but LARSON blows it away for

quality. ALso, Larson uses brass & stainless parts!

FYI, John KF2VW Rochester NY

Mr.Kovar, I have bought this same antenna and ended up selling it to a
friend
for a fraction of the original price. I have had nothing but problems with
their products so I have sworn never to purchase another Cush-crap product
ever again and tell all of my friends and anyone who will listen! Please
E-mail me and let me know I'm not alone. WB6KIO/Steve

Hi Jack.
Sorry to read about your problem on dejanews. Just wondering,
where are you in Iowa? I'm in Cedar Rapids.
The head of Cushcraft regularly reads postings to the TowerTalk
reflector on Contesting.Com. You may want to post there.
73,
Mark N3AVA/0 (Don't/Won't own any wimpy antennas!).

---

p. Similar problem here... took 7 months to get the wrong part. No phone
success, no e-mail success. You must get on the phone and use the phone
menu to get to a live operator. When you speak with her, DO NOT TAKE NO
FOR ANSWER.... Ask to speak with one of the owners. Call every hour if
necessary until they are so aggravated that someone will speak with you and
help you. After that... don't buy Cushcraft. Fred, K8PP
It's going to be awefully funny to see the guy with the
Cushcraft Tshirt, walking around under the dome with the
antenna stickingout of his ass!!!
Good luck...
(Goes to show what customer satisfaction has go to these
days...)

Hi Kovar:
I share your feelings and concerns but we will only get what we deserve
when we can get the amateurs to stand together. Maybe we could start a
news group dedicated to to exposing those dealers and manufacturers who do
not treat us with enough respect. Remember "If they don't appreciate you
for your money, they don't appreciate you at all". Good luck with your
antenna.
wa4puf --- Ralph

---

kovar,
I also own and operate Cushcraft antennas, and I found your posting on
the newsgroup.
I copied the letter you posted and attached it to a concerning letter I
wrote to the President of Cushcraft. I hope they get the message and do
you right. I would hate to be in your predicament.
It's too bad Business' are in it for the $buck$ now and do not give
reguard to their customers.
Sincerely,

Mr. Thomas Sexton

Wow!
I might be tempted to drive up to the Manchester Airport to just pick up
the units for you.
send me the exact description and part numbers, and if the weather breaks I
might just do it.
Thomas C. Sefranek WA1RHP
ARRL Instructor, Technical Specialist, VE Contact.

Do yourself a big favor, Switch to a much better company HUSTLER !
PS. Mosley isnt any better than Cushcraft. For HF go with HYGAIN.......
WA2MC.. Marty.

Jack,
I'd have to agree with you that Cushcraft customer service (at least for
us hams) has a lot to be desired. I can't fathom why returning a phone
call or e-mail takes days if at all. I've had Cushcraft antennas for
years and am satisfied with their on the air performance (I'm not a big
gun DXer), and I've owned everything from their VHF/UHF yagis to the HF
A3/with 40M add-on.
I move every couple of years in the military, and inevitably some parts
need to be replaced when I disassemble and reassemble so often. When I
ordered replacement parts back in 1994, I got to speak to a real person who
took the time to help identify part numbers and get me back on the
air in the minimum amount of time. I appreciated that. More recently,
when I needed parts for my A3 (which included aluminum tubing sections),the
company recommended I buy a whole new antenna plus add-on 40m dipole
(probably totaling over $500). Needless to say, I eventually ordered just
the parts I needed, which came to much less than that. But it was painful.
E-mail not answered, calls to tech support not returned for days, and when
I called to check the status of the order, they couldn't even tell me if
the order had gone out and what the tracking number might be. In one
instance, I got a "Mr. xxx" doesn't work here any more" from the front desk
operator. However, I was still occasionally getting e-mail responses from
him! Wow---quite a difference in response from just a few years ago!
I should have written them a letter at the time, but I was just glad to
get back on the air. Then again, would a letter have made a difference?
73 Rick N6CY

If you post this a dozen or so times Ill bet you hear from them. Bet you
get service real quick. Nail em on the net. Good Luck. Paul. N9EMX

Is it time for me to give up

The Weaver or third method is a development of the phasing method but is
different to it. It removes the need for an accurate broad-band 90
degree AF phase shift network by using a sub-carrier oscillator with
quadrature outputs and a couple of extra mixer stages. Extra fun is
added to the circuit operation by placing the oscillator frequency in
the middle of the audio pass band and defining the audio passband with
two low pass filters with cutoff frequencies equal to half the audio
bandwidth.

734. Power Lines for Radio

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-19 00:00:00 UTC
From: maddog@io.com
Message-ID: <36a3e082.3029132@news.io.com>
Source record: 74545

Hi All!

I've noticed in recent years the proliferation of new technologies that couple RF into the local AC (house) wiring for the purpose of controlling household lighting or appliances, intercoms, cable-less telephone extensions, etc. All this led me to thinking...

Aside from the obvious danger from casual contact with powerline voltages, or catastrophic component breakdown (which, apparently, commercial manufacturers have managed to deal with):

Could the AC line be used as an endfed receiving antenna? Given that most houses have 50-100 ft of wiring between the house and pole transformer, does this imply that the performance would be similar? How would one best (and most safely) couple to it?

Assuming QRP power levels, would it make an effective transmitting antenna? Would RF effectively stop at the feed transformer, or couple easily across it to the higher-voltage power lines (for a VERRRRRY long -wire antenna). Would this make it effective at low HF frequencies, like 160 meters, or even VLF?

Has this been tried by any of you?

monty

735. QRP HomeBuilder Freeware: plus info needed on T30-7 toroidal core

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-19 00:00:00 UTC
From: jenna@home.net
Message-ID: <E9Uo2.2201$9P6.7674569@newsgate.direct.ca>
Source record: 74546

Some QRP related software can be found on our website
at:

http://qrp.pops.net/qrp/software.htm

It is 100% freeware.

In addition, the CoilBuilder-99 program is lacking the AL value
for the T30-7 powdered iron toroid core.

In addition, from T80 on up to the T 184 size core, we have no
data for AL values for the number 7 core. We acknowledge that is quite
possible, that these core sizes in number 7 mix do not exist.

Does anyone have any data on the number 7 cores, particularily
the T30-7 core?

Yes, we have checked the Amidon and Micrometals web sites.

please post to this NG or email:

jenna_tashley@_REMOVE_THIS_hotmail.com or email via
web site address.

thanks!

Do I remember correctly an article in RadCom several years ago ('80s?),
"SSB Phasing Transceiver"? I'm sure that decribed the third-method of
SSB generation.

```
Below is the latest index of L.O.S.A and you can download the
complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa.htm

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 What is L.O.S.A all about?
------------------------------

This list was started back in -95 when I heard about (more or less)
uniqe problems that was solved by using a BASIC Stamp. Especially
Guy Gustavson's story (see #001) about how he saved his beloved cat
Kesha gave me the inspiration to start writing L.O.S.A. I hope Kesha
still is alive and having a great life. Now 3 years later there are
130+ applications described and I hope you will enjoy reading all
(or parts) of them.

The main purpose of this list is to get an idea of what other people
are using their BASIC Stamps for and maybe get some inspiration or
hints for your own projects. Some of the projects described in the
list also have links to source code and schematics for download.

1.1 How can I contribute to this list ?
---------------------------------------

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa.htm

1.2 List of contributions

I'm trying to identify a replacement for what I believe
to be an op amp of some type, 8 pin TO5 metal can
I think the N and S (shown as trade symbols) stand
for National Semiconductor and has the numbers
428 and 1820-0158 it's a few years old now and is
from a board in an HP sig gen. None of the catalogues
I've checked in list it and I have no cross reference books
CAN YOU HELP. HP say they don't keep spares for the
set any longer ????

Having read most of the postings in this thread, no one seemed to have mentioned that microstrip impedances are affected by the transmission mode. When coupling within coupled stripline filters for example, both odd and even mode impedances must be considered.
I would refer you to T E Edwards excellent book 'Foundations for microstrip design' or Young,Mathei & Jones 'Microwave filters,coupling structures and impedance matching networks'.

Lumped element models are useful, but are only valid for the narrow band case. They are useful for preliminary modelling, but anything more requires distrubuted effects to be considered. Consider also the restrictions in acheivable Q when using microstrip (about 200 max for microstrip, I think).

Keep a look out for emergency lifeboat transceivers. They have
hand-cranked generators for 500kHz and 8364kHz transceivers and
will be obsolete at the end of this month. Should be thousands
of units coming available worldwide.

Hello..,

I THINK,(but I could be wrong) That Microwave oven X-frmrs are right around that voltage range,(it could be more,I'm not too sure),and around that current..

My idea is,that you could go to a local garage sale,or thrift store,and buy a cheap $20 microwave,and 'steal' the transformer out of it..??
It would also have a rectifier diode,and capacitor.... You might be able to kill a couple of birds with one stone..??

just an idea... P.Taylor..,

I note that Jim appears to be referring to source current
and John appears to be referring to component current.

I don't recall any such regulation, but perhaps I missed it.
There was an article in Popular Electronics about 5 years ago
that gave complete details on building exactly what the original
poster wants - a DTMF-based squelch system for CB use. There
was no mention of legal complications in the article, as I
recall. Anyway - 'apolllo13', search through the Readers'
Guide in your local library for that article, and good luck!

Hello--
In practice, various advertisers in the Sunday newsmagazines have been advertising a commercial receiving antenna product for years. The ads read something like this (emphasis deleted<g>):

TURN YOUR HOUSE WIRING INTO A GIANT TV ANTENNA!!!

What you get for your $19.99 plus s&h: a plastic enclosure with AC power prongs on one end, and a pair of screw terminals for 300-ohm line on the other.

What's inside: a couple of capacitors.

How it works: sort of, with lots of ghosts due to random orientation of stretches of AC in-wall wiring (unless your house has aluminum siding, in which case all bets are off).

A sizeable market for these gizmos exists-- the ads have been around since the 1950s.

So, if you want to try building one of these... use capacitors rated for AC-line voltage standoff (e.g., with UL/CSA/VDE ratings) such as are used in EMI filters. Make the caps small enough to avoid passing appreciable 60-Hz current but large enough to present low reactance at the frequencies of interest. Terminate the caps into a resistor of a few kilohms (higher than receiver's input impedance, but low enough to limit any nasty transients). Disconnet all AC-dimmer or phase-controlled products, and declare the house a vacuum cleaner-free zone when you're operating<g>.

And, let us know how it works.
73,
Brad AA1IP

752. Re: outboard SSB add-on?

Hello,

The G3TDZ 73 Khz phasing SSB receiver used by lowfers should make
an excellent SSB addon at 455 khz just by changing the oscilator to 455 KHZ.
I intend to give this a try as soon as i can.
http://www.mnsinc.com/bry/73khz/g3tdz/g3tdz.htm
The URL is on BRYs pages, and the ckt diagram, and PCB layout are all there.
Also, the transmitter and receiver are on separate boards.
ALso, the receiver has a powerful audi amp, and use standard opamp +mc1496
chips.(No hard to get parts). Mc1496 may be better than Ne602, as it allows
nulling.

If anybody is using this G3TDZ design in this manner, I would like to hear it.

Your best bet is to buy a nice big anti-static mat that is designed to
cover the top of a bench. It is already set up for the proper
resistance (you don't want to just dump a static charge to ground,
you want to bleed it away slowly so it doesn't induce any unwanted
voltages in your apparatus). You can buy them through Newark, Allied,
maybe Digi-key for not much money. You have to ground the mat to the
power line safety ground (green wire) and wear a static wrist band to
be sure you don't zap your project.

Both flavours of SSB have been in RadCom (mine are at home, or I could
point you at issues...). The most recent (1996?) was a nice Weaver rig
that used switched capacitor filters.

I would like to use some common 4" plastic pipe and caps to make a weather-resistant cylindrical enclosure for a gps receiver.

Should I use PVC or ABS? I've heard that PVC is a "lossy" material to wind coils on, and I wonder if it would impede or degrade the GPS signal. Would ABS be a better choice?

Good for you, Roy. You (and I think one other) got my main point:

They ain't nothing until you hook a source to them! The question then becomes how the source is hooked in. Each would have different 2-port parameters.

There is another problem with using a link coupling into the L. This essentially becomes a transformer. You could work thru the math and find the lumped circuit equivalent and see that there are opportunities for multiple resonances. Perhaps this is where the 'series vs parallel resonance' question comes from?

El Cheapo power line antenna:

Follow procedure exactly or DEATH could occur.

1. Obtain a polarized SPT-2 line cord. This is the type using "zip" cord. Length should be at least 5 ft.

2. At the plug end, cut out about 1/2" of the wire connected to the wide terminal - thus disconnecting this wire from the plug. Place electrical tape over any exposed wire.

3. At the opposite end, separate the wires for a bout an inch, identify the wire connected to the narrow terminal, and clip it off. Use electrical tape to cover the clipped end. Strip and tin the remaining wire if it isn't already.

4. To double check, check continuity between the remaining wire and either of the prongs with an ohmmeter. There should be none. Connect the remaining wire to the antenna terminal of your radio, and plug in the cord.

The two adjacent wires in the "zip" cord form a capacitor which gives adequate coupling, and is perfectly safe IF the procedure above is followed.

The formula to determine what the length of an antenna should be based on the known frequency is

468/Freq in Mhz

468 divided by the freq in Mhz. This gives you the total length of an antenna. For a dipole antenna, simply split the answer in half, to determine the length of each leg, or, the formula is modified as such:

234/F in Mhz. (to give the length of each leg, which is the same as the total length found by using 468/Freq in Mhz.)

PVC is USUALLY OK-but 2 notes:
Use WHITE PVC only-the colored types generally have higher loss.
Test the PVC you plan to use:
1.take a piece of the PVC
2.take a cup of water
put both of the above into the microwave oven.
Run it for a few minutes.
If the PVC heats up, then don't use it(but remember that it will heat
slightly from the water heating up nearby).

wavelength = 300,000,000 / frequency

with wavelength in meters and frequency in Hz.

A halfwave dipole antenna will be _approximately_ half this long.

A quarter wave vertical will be, obviously, _approximately_ one quarter this long.

Go to your public library. Look up the Ham Radio (or Amateur Radio) section. Hunt for the ARRL handbook. There may be other books. If your library does not have such books, go to the next town.

Soap box mode on:

It suprises me how many people do not know how to go to the library and look things up---and you are at a university? (ref: the .edu in your address). What do you think we did before there were such things as www.hotbot.com?

> a few 1N4001, 1N4007 and 1N4148 is just about it.)

Charles Wentzel already noted a couple I was going to add: '4401 and
'4403.
My latest additions all seem to start with things like "MMBT" instead of
"2N" with the exception of the 2N7002. That is, they come in things
like
SOT-23 packages. With some trepedation I got into surface mount, but
now
would hate to go back. I surface-mount thru-hole parts, too. Oh, I
should
also mention 2N/MMBT 5087 and 5089 as low noise, low current
transistors.
For certain source impedances (in the few-k-ohm range), the 5087 has
extremely good noise performance. Some JFets are also quite good in
that
range. For 100 ohm or so source impedance audio (sorry, I know that
folk here tend to think in terms of RF, but I do quite a bit of work at
audio), I've gotten extremely good performance from 2n/MMBT 2222's:
measured around 0.6nV/rtHz.

Cheers,
Tom

I'd add (from personal experience): Keep a close eye on
what's going on in the microwave the whole time, and be
ready to stop the experiment. I tested (or was that
"toasted"?) some plastic that way, and ended up with a
serious fire inside the microwave. Melted/burned the
plastic cover on the stirring fan.

Cheers,
Tom

OK, you aluminum hoarders, I know you're out there....

-I need some aluminum panel and chassis and Will buy / trade for it.

-13"x 17" x 3" aluminum chassis (also interested in 4" or 5" high

The following size 1/8" panel or relay rack panel
Painted or unpainted are OK.

19" width :

one 13 1/4" height (prefer un notched for this one)
two 21 3/4" height (one un notched preferred)
one 12 1/4" height

plus an Assortment equal to 35" height to cover the back of a bud
cabinet.

The 4046B CMOS PLL, can be used as a frequency to
voltage converter. The standard CMOS version may not
work reliably at 1.8MHz. A 74HC4046 may be a better
choice.

These power supplies have voltage sense on them. I was planning on putting a diode on each b+ and the sensor of each powersupply to the connection point. I still have the problem that both power supplies have a voltage adjust pot and might be at a different voltage. I guess I could reference both pots to the same voltage somehow.

>Perhaps this is where the 'series vs parallel
>resonance' question comes from?

No, it comes from how you define 'resonance': maximum voltage across the C, across teh L or maximum current. In a low-Q circuit, they occur at slightly different frequencies. If the Q is much above 10, the differences are very small, being inversely proportional to Q-squared.

Peter,

I would refer you to T E Edwards excellent book 'Foundations for microstrip circuit design' or Young,Mathei & Jones 'Microwave filters,coupling structures and impedance matching networks'.

You will need to be familiar with S parameters to undertake any meaningful microstrip design work.

YM&J is a good 'cookbook' if you like, and can be sourced from internet booksellers for about £60.

On the contrary, you can design "meaningful" microstrip filters even if
you don't know your S-parameters from a hole in the ground! ;-)

If you choose to build narrowband bandpass filters with identical resonators,
you can empirically characterize the unloaded Q of your resonator and
empirically characterize the coupling between resonators as a function of
their spacing using Dishal's tuning technique. Then you can design any order
filter based on predistorted k and q parameters and analyze it as well.
See Zverev's Handbook of Filter Synthesis for details.

It works for microstrip resonators, stripline resonators, cavity resonators,
helical resonators, and LC resonators.

That is how we did it back in the olden days.

> help.Thank's Marcus.....

Get a copy of the ARRL antenna book. It has an excellent section on the
yagi. I dont know about later editions, but the one I bought a few years
ago came with some software. One of the programs was a yagi program
where you can play with designs and change the element diameters,
lengths and spacings. It calculates the impedance, gain, f/b, etc. It
doesnt care about frequency, so you could design antennas for any band.
The book will also give you a fairly firm footing in antennas generally.
Good luck

Don

It's the "fillers" - some are added for strength, others for color or UV resistance, which they incorporate into plastics (not just PVC, but ABS/SAN/PP/PE) which cause the "heating up" in the microwave oven.

I would guess that you can get most of these molecules to vibrate at some frequency anyway, (didn't we do that in physical chem lab?) , but some of the fillers cited above are metals (Al, Si) and these, I would think, would be most "lossy".

801. Re: HELP! Paralleling 2 switching supplies

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-20 00:00:00 UTC
From: &NM7U <&NM7U@hevanet.com>
Message-ID: <36A5C278.AD31DEA1@hevanet.com>
Source record: 74600

Paralleling works well for loads. It is almost never advisable for sources.
If you have any way to allocate loads to separate supplies, do that.

Paralleling can work if four conditions are met.
1)Both power supplies must have extremely well behaved transient behavior,
especially
in and out of current limit. (many don't)
2)Current limit must not fold back (many do)
3)Each supply must be capable of running at full load continuously
while the other is unloaded. (significant reduction in system reliability)
4)Your load can tolerate some change in voltage at around 1/2 load. (many can)

Set both supplies for the same voltage. They'll be slightly different,but you
want to minimize this.
Hook 'em in parallel and forget about it.
One supply will supply ALL the load up to it's limit.
At that point it will current limit and the voltage will drop to
the voltage of the second supply which will take the load up to
the total limit of the two supplies.
You'll get a step at the point where this current limits equal to the
difference
in the voltage of the two supplies.

This works ONLY if the supplies are extremely well behaved. Any oscillation
or instability can set up conditions that can destroy the supplies and/or the
load.
The supplies I build have slightly negative output resistance. This complicates
further.

There are some disadvantages.
1) System reliability is worst at 1/2 load with one at max, and may be MUCH
worse than
two supplies each running at 1/2 load.
2)If you have overvoltage protection, there may be some interesting things
happening
at turn-on if one comes up much faster than the other, or if one blows a fuse
and crowbars
the other.

You cannot judge any commercial plastic simply by the name of its main constituent. (Would you try to judge beers that way? Hey, they're all basically water - if it's the right color, that'll be close enough...)

Pure polyethylene is excellent for RF, and that is what's used in coax for example; but drainpipe is very unlikely to be the pure material. Likewise someone else mentioned good results with "the white PVC". Make that "SOME KIND OF white PVC".

The base material, and possibly the color and the intended use, are all pointers in the right direction, but you always need to test the actual material that you have.

The microwave oven test is the best comparative test of RF losses available to amateurs. If you put several different samples in a turntable oven so that they're all exposed uniformly, it's easy to judge which ones get warmer than the others, allowing of course for the mass and shape.

(Don't forget the half-glass of water, and make an early check in case something is cooking rapidly, to avoid Tom B's little problem...)

I am in need of a dual gang variable capacitor, at 365 pf per section. This is not carrying any power, so one from an old broadcast band receiver would be fine. An air spaced unit with 1/4" shaft is what I'd really like. Also, if anyone has a couple of little inductors at 100microH, I need them as well. Can't see paying the $8 shipping for $1 worth of parts. Please e-mail to <ve6inm@telusplanet.net>. Thank you. 73 de VE6INM (Glenn)

I am sure that this was an oversight, and you can probably expect everyone in the NG to let you know, but the formula that you presented is for a half wave antenna.

But also, to the original poster, go to one of your local book stores and pick up a copy of the Amateur Radio Handbook. All the antenna formulas and explanations you can stand are there.

My only problem with Ian's microwave oven test is that it is only
and indicator of a material's absorption at 2450MHz, the frequency of
the oven (at least US models). Measure the performance of the material
at the frequency of use. Changes in the antenna return loss or measured
degradation of gain on a makeshift test range as materials are substituted
are reasonable measures of a material's suitability as a radome. Its not
realistic to assume that a meterial will be unusable for all RF
applications because of a single frequency data point.

Some years ago I made a theoretical design of plug-in product detector
to go into BFO valve socket of AR88 with minimum amount of changes to
the receiver. If you are interested to see it, please send an email, it
is 15kb gif file
The general rule for design met are; if the original BFO is ECO type the
product detector should use E-C-Oscillator, and if it was Hartley it
should continue to be. Suggested valve for product detector is
6AJ8/ECH81, with noval base holder mounted into an octal socket, with
some additional components. Believe this circuit may be adapted for
BC342, but not for BC348 and Hallicrafter S-40A

if you have a high level language or spread sheet on your computer, try:

1000*rand()/Freq

It will give you the length of a random wire antenna up to 1000 ;-)

Except for special applications I have always seen strip line circuits layed
out so that everything is in a straight line (input to output).

Resonant circuits and/or matching circuits run at right angles to the main
line

Something like this:

```
I------A--------O
* *
* *
* *
```

I is the input. O is the output. A is the amplifier.

The * would be perhaps a quarter wave section for filtering.
The '---' is the main strip line.

Anything else would probably have a problem with unwanted coupling.

The only time I saw a curved one was on a 2.5GHZ vco, where a strip line was
curved into a circle to form the resonant circuit for the oscillator.

817. Re: curved v. chamfered microstrips

Newsgroup: rec.radio.amateur.homebrew

Source record: 74616

What's your frequency of application, and do you have
EM simulation tools or a good curved-microstrip model?
Curved microstrip is less dispersive and can produce
networks having better loss characteristics.

Also, the "best" miter for producing constant-impedance
"chamfered" microstrip actually reduces the minimum width
at a 90-degree bend, which is important if you're also using
the line to carry DC-bias current.

Bottom line - used curved microstrip unless you have no
means of modelling the true electrical length (which is
slightly shorter than the centerline length, % depends on
bend radius), or unless you don't care about the other
factors and want to draw your layout the lazy way.

best regards,

Marty Jones

This is a low slew rate noisy op-amp - '741. Check out natsemi's web page - www.nsc.com for a better pin for pin replacement.

It's more than a single data point, because the losses can be expected
decrease in a pretty uniform way with frequency. For the kinds of
materials you'd reasonably consider as RF insulators, there are unlikely
to be any molecular resonances in the UHF/VHF/HF region that would bring
nasty surprises. So if a material tests out good at 2450MHz, it should
be even better at lower frequencies.

If a material gets warm at 2450MHz, it may still be usable at lower
frequencies in a light-duty situation. But even the best RF insulating
materials can still fail if they're put in an impossible situation, eg:

* locations where the electric field is particularly fierce, like the
top of a poorly-designed loading coil

* situations where they can be burned by arcing (that will even damage
Teflon)

* situations where skin losses make conductors hot enough to melt the
dielectric (a probalem with polystyrene and polyethylene).

The only guaranteed way to be sure about any insulator is to try it in
the end product. The microwave oven test is only useful for pre-sorting.

I've searched for a formula in the books I have, but I found none that
described a curved microstrip. Do you know of one? Or perhaps a
spreadsheet...
Perhaps a stupid remark:
All my impedances are 50 ohm (or i do impedance matching with LC close to the
port), so does the electrical length matter? I don't want do do quarter wave
matching.

>or unless you don't care about the other
> factors and want to draw your layout the lazy way.

Nah... I want do to it right... the problem is lack of experience.

Kind regards.

Ghole

There is a design for a high-performance converter in the File Libraries section of the Longwave Club of America's web site -- <http://members.aol.com/part15/lfconvtr.htm> If you don't have too many nearby AM broadcast stations, you can get by with a very simple circuit using an NE-602.

HI, I'm looking for a schematic for an Icom Radio/PC interface (CT-17). I have in my possession a couple of Max 232A chips which should work. I am looking for schematics that use these chips (or the 232). I know there have been a couple in QST, but my issues seem to have been misplaced (april 97 is one). If anyone can scan me a copy of any I would certainly appreciate it. Or if you can point me to a web page, that would be great also. I have a copy of a schematic for one that uses 22uF caps, but the MAX literature says the 232 only needs 1 uF and the 232a only needs .5uF. So I don't know if that one would work or not. Any help or info is appreciated. Thanks in advance.

I've got some toroids that I bought from Amidon and I've lost the ID tag for them. They are the same size as an FT-37-43 but wider, just under twice as wide. Does anyone have an idea of what they might be, I'll eventually figure it out because everything I bought was for projects in the W1FB notebook but I could use a hand if anyone has an idea. Same powerdered iron color, not colored.

Hi Marty,

Currently we are marketing only Delta Loop driven array Monobanders.

Driven array multibanders of this design present some unusual mechanical
and feed point problems. (i.e. Plumbers delight vs parasitic array).

Currently we are looking at one proposal for a single feed multiband
version where the lowest freq band will be plumbers delight and the
others are parasitic elements.

If all goes well this will be available in winter of 1999.

Thank you for your inquirey!

I believe this is really a 741 op-amp with the addition of
JFET source-follower inputs, isn't it? Not just any 741
will swap for it if you want the low input current.

Tim OM,

Have you considered winding a core with say 10 turns, then measure the inductance with a grid-dip meter
or bridge or whatever you can get access to? You can then work backwards and compute
the Al factor (uH or mH/1000 turns) easily. This won't tell you the correct frequency range necessarily
of the core, but by measuring the Q, you can get a general idea of this too. This is just ordinary
old amateur-boy measurement stuff; use your own ingenuity to work with what you

Tim,

I suggest just winding a test winding, say 10 turns, on a core and measuring the inductance
using any one of several methods. Then you can work backwards to come up with the
permeability or AL factor. That is what I do with junkbox cores. It will at least tell you whether
it is ferrite or powdered iron core.
FT refers to a ferrite core, 43 refers to the type of ferrite material, per Amidon's data sheet.

I have been using something for years that my dad came up years before that with no problems at all.

Simply connect a christmas tree bulb (aprox. 3-5 watts) in series with a diode and your battery. It is a trickle charger but works very well and will charge anything from 1 volt to about 50 volt batteries. Naturally the larger the battery the longer it takes. You can adjust the charging rate/current by putting different wattage bulbs in. I use a blinking bulb which will be on steady until it is charged then begin blinking.
Note: this circuit can be dangerous because of the potential for shock.
I wired the battery between the bulb and the diode with the hot going to the bulb and have never been shocked by it but caution should be exercised.

What about that Bayliss generator?

I am also trying to take my handie talkie with me hiking, due to
antenna restrictions, it also gives me a good excuse to go out and get
some fresh air.
I recently purchased a Cherokee all-mode
(since I added cw) walkie talkie, A H 100
with the intent of converting it to ten meters
or adding a transverter, since no one makes an all-mode ham walkie
talkie, although the radio did not come with any technical or schematic
info, I should have known better!
Does anyone know how to convert this radio to ten meters?
It would hopefully not involve pulling the boards with surface
mount components apart
as they are just hanging by a thread anyway!
when purchased from the factory.

P.S. this radio is useless on 11 meters!

A hand cranked generator was standard issue in WW2, don't know how
many survived. From memory they were mounted on a tripod and there was
a seat attached to one of the legs so that the user was fairly
comfortable while cranking. Can't remember what the output was even
though I owned one for field day use.
When I was a young ham in Oz VK3ALZ powered a complete 2 meter AM
station with one using a pair of 6AK5s in the final. The power had not
reached his QTH. His signal was quite characteristic because of the
mechanical generator noise. Strangely enough the "Grinder" as we
affectionately called him worked more DX than any of us with AC
powered stations.

Do a search, there are several pages that give the ten meter conversion, I have it on my other computer if you can't find it. It's a very simple thing to do. As I recall, it consists of putting a blob of solder on three open trades just behind the push to talk switch. In some cases, you have to let the internal battery discharge before it will work. To activate on 10 meters, you power up the radio with the Ch 9 button depressed. you can then switch from a group of channels that will cover most of the bandThe problem is that you can't get 5k steps. There is a post that gives a mod for 5k steps, but the post has mistakes in it and the author has not corrected it and has not replied to my e-mails.If you turn the radio on without holding the Ch 9 button down, it reverts back to normal CB use.I have tried to make 10 mtr contacts with mixed results. With the band open and on a 3 foot antenna, I have made a few contacts. Good luck, Paul

Amidon sells a core that's the diameter of the FT-37 but twice as thick -- believe they call it an FT-37B. There are a number of tests you can run to pin down the ferrite type, but to make any suggestions I'd have to know what kind of test equipment you have. One quick test you can do is measure the resistance of the core with an ohmmeter. Where you put the probes doesn't matter for this test. If it's 43, it'll measure open (at least greater than several megohms). If you measure any amount of resistance other than open, it's probably one of the 70-series ferrites or similar. 60-series ferrites will measure open, too, so you can't use this test to distinguish between them and 43.

the 8874 has 400 watt disipiation.
max plate voltage 2200.
max plate current 250ma.
500mhz range.
amplification factor 160.
6.3 volt at 3.2amps on cathode. (I think this is heater voltage
and current.)
suppose to be operated AB2
it says here, the approximate output power is 505 watts.
the book says nothing about pin configuration, but if it is like
the 8873 it is like this,

*H *G1
*H *K
*G1 *K
*K *K
*K *G1
*K*P

counting clock wise from the Plate(P)
1=k,2=k,3=k,4=g1,5=h,6=h,7=g1,8=k,9=k,10=k,11=g1.
hope this helps.

Source record: 74506

Dana's right, and I sure didn't catch this when I read the earlier
announcement.

I just checked my twenty year old National Semiconductor databook,
and the LF13741 isa "monolithic JFET input operational amplifier".

It goes on to say that "The LF13741 is a 741 with BI-FET input followers
on the same die. Familiar operating characteristics - THOSE OF THE 741 --
with the added advantage of low input bias current make the LF13741 easy
to use."

The schematic shows two fet's on the inputs to the op-amp (and two other
fets as current sources) and then shows the op-amp with a block diagram
labelled "741".

Obviously it was chosen in the scope because of it's high input impedance,
which in retrospect looks like a clue that it isn't a run of the mill 741.

It does have identical pinout to the 741, though the databook shows it
available only in a round package.

Any more recent op-amp will have better specs in terms of slew rate and
frequency response. And virtually all single-package op-amps will have
the same pinout.

The important thing to get is something that has JFET's on the input.

You're right about the shipping. I once mailed someone a couple of IC's
I'd pulled off a circuit board, and the cost of mailing them was
ridiculous.

I've said it before, but those "365-pF variables" tend to be a term for a
generic variable capacitor. The place to look is in an old radio. I've
found plenty in the garbage. Garage sales are also good, though this is
hardly the weather for those. You might also check the Salvation Army or
some other place that accepts donations of old household items and sells
them for very little.

The exact variable that you get will vary with the radio. In really
recent radios there may not be variables, but will be voltage tuned with
varactors, but I'm still finding cheap radios with actual variable
capacitors. More recent radios will tend to be two section, with one
about 365pF and the other maybe 160pF or so; of course, if it's an AM/FM
radio there will be additional sections for the FM side. Older radios
will have three sections, one for RF, another for mixer input, and the
third with somewhat less capacitance for the local oscillator. Although
I've seen 2 section 365pF variables, I don't think I've ever taken one out
of a radio; they'll either be two unequal size or two equal and one
lesser section.

More recent radios, especially smaller ones, will not have air spacing,
but mica (or is it some other material?).

What you can use will vary with the application. Often two sections are
specified in order to get greater maximum capacitance; you might get by
with a 365pF or so section and the local oscillator section. If it's not
handling power or the variable element in a variable oscillator, you may
not need an air variable.

Using a pair of twisted wires as a VERY few pF capacitor has been done for many years. Doing it at Microwave, however, creates a problem.

Consider the assembly. There is some wire length, which is inductive, and capacitance between the two wires.

Yep.... A series resonant circuit.

Down on the HF bands, it doesn't matter. The 3 or 4 nH of inductance leaves the self-resonant point up in the hundreds of Megahertz.

Of course, if you are up at several GHz, well..... The combination is ABOVE self-resonance and now it behaves as a primarily inductive component.

Jim

I sure wish I didn't have to do this to my address, but spambots are a real irritation to me. I get too much bulk email as it is !!!

Isn't a very small capacitor required to couple to a 1/2 wave resonator? I was reading this in "Microwave Engineering" by David Pozar. Capacitor was 0.001 picofarad. That is very difficult. It is kind of big for a gap capacitor, and kind of small for a surface mount capacitor.

I have been experimenting with placing the coupling capacitor somewhere in the middle of a 1/2 wave resonator. It seems that the impedance is lower towards the middle, allowing the use of a realizable capacitor (or varactor) to couple to the 1/2 wave resonator.

One place would be
Linkname: Dan's Small Parts and Kits
URL: http://www.fix.net/dans.html
I ordered from them some years ago and the service was fine. I was all
set to order last year but being in Canada created a problem because he
changed his policy, first to no orders outside the US, and then a fifty
dollar minimum. I see he's changed it again to just ten dollars for
shpping and handling to Canada, so I guess it's time to go through the
list again.

He's pertinent to this thread because while he has good prices, he is
dealing with the sort of devices that commonly show up in the amateur
magazines and books. If it's common, he likely has it, and likewise
if he has it, it's likely to be common.

An advantage to his company is that while you are likely to get common RF
active parts, he also carries important RF parts like variable capacitors
and toroids and sometimes crystals and feedthrough capacitors etc. If you
need parts, ordering from him may mean that you can get all the parts you
need, whereas if you ordered from more general electronic suppliers you
might have to get semiconductors from one place and toroids from another,
etc. I am forever putting projects aside because I need one little thing,
and being able to take care of a number of items with one order is a
certain means of getting those projects out of the way.

To be facetious -

with great care unless you want poor phase noise, large amplitude variations and other problems.

Couple the reversed biased varactor into the oscillator using a small high-Q capacitor or nearby coupled track. Make the varactor coupling as small as possible to acheive the tuning range sufficient to swallow up any uncertainty and any temperature effects and no more.

There are several places you can couple the varactor but on the collector of the transitor is not uncommon but does seem to cause signifocant Pout variation. In fact you can couple anywhere where there is significant circulating power.

The message <789ksn$jt9$9@alice.walrus.com>
from marc_k@walrus.com (marc_k) contains these words:

> Older radios
> : will have three sections, one for RF, another for mixer input, and the
> : third with somewhat less capacitance for the local oscillator.

Most valved domestic radios built in Europe up until 1960 used a twin gang 500pf variable. The lower value was more common in the USA. Sometimes the plates on the osc section were shaped but this was not common. It was cheaper to assemble from identical plates.

The effective capacitance of the osc section was reduced using a series capacitor, known as a padder and placed in the earth lead of the tuning coil. By using a suitable variable trimmer capacitor across the coil and the variable padder capacitor in series with the coil it was then possible to get what was known as "3 point tracking"

This means that the Mixer and Osc sections [plus the RF section in a 3 gang tuner] were only exactly in correspondence at three frequencies within, say, the medium waveband. The trimmer was usually set at about 1.4Mhz and the padder somewhere around 700Khz when dealing with the MW BC band. At all other points there was a slight divergence of tuning but this was not great enough to seriously degrade the performance of the RX.

The shaped oscillator vanes were actually made in two versions:-

SLF [Straight line frequency.]
SLW [straight line wavelength]

You made your choice depending on the dial calibration you required.

Another point to keep in mind is that the shaped vanes were only suitable for use over a particular frequency range. The *law* of the plates was designed to keep the osc in step over a specified frequency range [usually MW] If you wanted a multi-band design the shaped plates were not an option.

Look in Electronics World magazine.
You will find several adverts from shops selling surplus RF test gear.

Find the magazine in W.H. Smiths.

Thanx to all who replied with possible sources. Dan's Small Parts has a unit that is just what I need, at $15US. Since this is going into a homebrew sig. gen. the power handling is not critical. Actually the value can be anywhere from 250pf to 500pf, but the 2 sections of the oscillator circuit have to track with some linearity. My design is a 6 band overlapping range idea, and the 365pf value was chosen because of availability. The problem is that the old tube BC rcvrs are getting harder to find. In worst case, I suppose I could use 2 unmatched sections, and change the values on the 6 inductors in one half to try and get the same resonance freq. in each section.

To think of all the old 5 tube BC rcvrs that I scavenged for a couple tubes and tossed into the landfill. That's reason enough to convince the XYL to allow another accumulation of Junque. 73's and thanx again to the group.

I already did. And I feel I wasted my money. This book contains little
useful information on either theory or practice.

What it does contain are:

Simplistic overviews
Designs without explanation
Screen shots of CAD programs

One wonders if it is an advertisement for =SuperStar=.

Thanks. What about using two back to back varactors? This would halve the capacitance. One of my problems seems to be that none of my varactors will produce a capacitance as low as is needed.

Isn't there "large circulating power" almost everywhere in an oscillator?

Thanks,
Bert

867. Re: Needed - Dual gang Vari-cap

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-22 00:00:00 UTC

Unfortunately, the variable capacitors found in most of the AM transistor radios (the ones that don't use varactors) have an antenna section of about 140 pF and an oscillator section of about 60 pF, so they aren't suitable for circuits that require a dual-gang 365 pF capacitor.

> produce a capacitance as low as is needed.

From what I understand, front to front. This would actually help reduce your phase problem as well as the capacitance would be seen equally through out the sin wave cycle.

Hello, as promised I'd come through with more complete,
original, good to excellent condition Antique electronic
and audio catalogs/sales brochures.
All are as represented, ALL SALES FINAL on literature.
Prices below are firm, and INCLUDE SHIPPING to anywhere
in the lower 48 U.S. states. Others by quote. Some of
these catalogs have stuff YOU ONLY CAN DREAM ABOUT...
Thanks, first come, first served ! You will enjoy these.....
Please send your orders via Email to : Tubelit@aol.com

Regards, Joe Pratt

THIS IS WHAT IS HERE RIGHT NOW:

ADR audio catalog, looks like earlt-mid 70's, 7 pages, 4.00

Audio warehouse catalog, Vol. 1 Issue 2, looks like early-mid
70's, 8 pages, 4.00

Allied's supplement #133 to 1953 cat.#131, 48 pgs.
of the good stuff, tiny fold in one corner, but nice! 25.00

Allied's "festival of values" supplement # 182, 1958
100% complete, good shape 48 pgs, 18.00

Allied's winter sale catalog # 263, 1966, 89 pages in excellent shape,
includes all the Knight kits and order form, 25.00

The "Audio Exchange's audio fair 1955 edition, comes with extra
fold-out equipment flyers,nice condition! 8 pages plus 3 flyers, 9.00

"The care and feeding of power tetrodes" original, mint condition,
Eitel McCollough's rare (these days) guide to running the big stuff!
printed in the 50's, well illustrated, 25 pages, 25.00

Federated purchaser's 1956 catalog supplement for "High fidelity
sound equipment",a fold-out single page type, nice condition,
have 2 identical in same condition, 8.00 ea.

Federated purchaser 1960 catalog , 303 pages in nice shape, but
page 1 has some writing, has small hole in the last 6 pages,
but still real nice.. 23.00

"Heathkits for 1955" catalog, nice shape except a couple small
stains on cover,100% complete! 47 pages, 25.00

Heathkit 1956 fall flyer, near mint cond, 7 pages and order form, 12.00

"Heathkits for 1957" catalog, excellent save for a little stain
on cover, 100% there, 55 pages, 25.00

"Heathkits for 1958", This is THE one! All the TX's are in here!
near mint cond, 57 pages, 25.00

Heathkit 1959 catalog, near mint, shows the W-5M kit for 59.75 ! 100%
complete,....28.00

Heathkit 1960 catalog, 100% there in NICE shape, 66 pages, 25.00

Heath catalog,July, 1961, very nice cond. w/order form, 39 pages, 20.00

Heath catalog, Fall/winter 1961/62, Small tear on cover,
and cover loose, but 99% there,just missing order form, 99 pages, 20.00

Heath catalog, #810-50, 106 pages, very nice, 25.00

"Give a Heathkit" for Christmas, catalog supplement 80/31, Oct. 1962,
100% there, but cover is loose and worn, but OK looking,47 pages,15.00

H.W. Sams co. 1984 Photofact anual index, 208 pages, very nice, 12.00

H.W. Sams co. 1985 Photofact anual index, 216 pages, very nice, 12.00

Hudson Hi-fidelity catalog, 1958, 62 pages, all the goodies!
great shape, 19.00

Key Electronics, Inc. 1963 audio discount cat# A-17, 20
pages, very nice shape and very interesting, 15.00

MusiCraft special flyer, icludes schematic for the 60 watt
6550 audio amp! Looks like 50's or early 60's, comes with
free extra, different copy, 10.00

The NEW YORK TIMES, Sunday, March 15, 1959 Hi-Fi- stereo
special section 10! RARE RARE RARE in fairly good shape,
but yellowed, of course. 15 full size newspaper
pages, has been folded since 1959, REAL COOL STUFF 15.00

Radio Shack "newspaper type" catalog, # 117, Jan/Feb 1962,
"Annual mid-winter sale",near mint except for one small, tiny
tear, 40 pgs., 20.00

Sound reproduction inc, E. Orange, N.J. catalog # 50, 1977,
16 pages, 5.00

Terminal Radio Corp's 1959 high-fidelity 'Audio Digest"
catalog, straight from "Radio Row"
on Cortlandt street in NYC, 90 pages CRAMMED
full of dreamy items, rare and in nice
shape, 25.00

Zalytron catalog # 161, lotsa audio goodies! Nice shape,
a couple of small tears, tube info inside, too! 91 pages, looks like
early to mid fifty's, 15.00

Thanks to all, I'll post more as I find 'em!
Joe Pratt

yes, I noted it, but I wouldn't suggest modifying an old receiver in
such a high degree when it is not neccessary, it is just too many
suggested modifications where the operator does not try to match the
modification to what is already available

872. Drake R4A Crystals Wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-22 00:00:00 UTC
From: mark beutler <mbeutler@tds.net>
Message-ID: <36A8B4A8.E0CD1022@tds.net>
Source record: 74440
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

I am soon aquiring a Drake R4A receiver and would like to get crystals
for the 11-90 meter shortwave broadcast bands. These would be (in
MegaHertz):
36.7
32.5
30.0
28.5
26.6
26.1
24.6
22.7
20.5
18.2
17.0
15.8
15.0
14.3

These are the actual crystal freqs, not the receive freqs. Anyone
having crystals known to work in the Drake (ie: series resonant, the
right size to fit the Drake, etc.) in the above freqs that you wish to
sell please let me know.

johnoz@indy.net (John Occolowitz) writes:
>>Just wondering if I could easily make a hand cranked generator to power
>>my HT... just for survival reasons. Is there any reason I could not use
>>....

If you open the "bicycle generator" so many have mentioned and lift the
ground lead, you have an AC generator which can be fed to a small
transformer to produce other voltages. Or fed to a pair of diodes to
get full-wave rectification, which you can use to charge your HT battery.

>A hand cranked generator was standard issue in WW2, don't know how
>many survived. From memory they were mounted on a tripod and there was
>a seat attached to one of the legs so that the user was fairly
>comfortable while cranking. Can't remember what the output was even
>though I owned one for field day use.

I have one of those (sans the tripod, unfortunately).
You can probably still buy one of your own from FAIR RADIO.
Be prepared to use tube-oriented voltages (plate and filament).

You didn't mention the "Gibson Girl" transmitter which was used by
servicepeople downed in boats. Shaped somewhat like a female's anatomy
(wider at top and bottom and narrow at the waist), it was held between
the knees and cranked. The cranking also sent a pre-formated CW SOS.

>> secondary OR something close.
> I THINK,(but I could be wrong) That Microwave oven X-frmrs are right
>around that voltage range,(it could be more,I'm not too sure),and around
>that current..

Having recently taken a microwave oven apart just for the transformer,
mine is about 2200 volts at only about 300 ma. And one wire of the HV
output is grounded.

So get TWO of them and use as a 4400 volt CT xfmr at (about) 300 ma.

The two magnets on the tube are as much fun to play with as is
the transformer!

Front-to-front or back-to-back are identical in regards to
their ability to handle sine waves. The only difference is the
polarity of the bias voltage that controls the effective capacitance
value.

i am trying to find out some information about a motorola rf power
transistor. this was a custom part that motorola manufactured and put
some custom part number on. motorola cant identify it.
it is marked
m9583
185
8644

and it is in a studed ceramic package (case # 244) with 4 leads suitable for
stripline mounting. i am interested in any ideas anyone has on how i can
determine their characteristics. or any info anyone may have on this.
thanks,
dan stanger

An Australian design for an SSB adaptor. Quite unnecessary.
It'll hack SSB without any extras if you know how to drive
it properly.

Yeah, I've ordered from Dan a few times, and recommend him highly. I may buy from him soon again myself.

Sorry! I neglected to specify whether the stub was shorted or open. In
my post, I meant open.

Open stubs are always easier to make (no complicated vias to ground)
and, in my experience, are more predictable and show a slightly higher
apparent Q.
Other benefits include DC isolation from ground, in the event your stub
is live (say at the input or output to an MMIC). While a blocking
capacitor could be used with a shorted stub, it's yet another component
to add, and besides, the Q will suffer.

One thing you might look into is that each xtal will work 2 or 3 bands each. Depends how you set the preselect. Say if you had a 20.1 xtal that is used to go to 9 mhz. xtal -11.1 = 9.0 mhz. You can also go xtal -11.1 + xtal = a new higher band. So 20.1-11.1=9+20.1=29.1 mhz. In many cases you can get a third band appx 185 khz below the xtal freq. But you need a hot xtal osc. So if you had a 10 mhz xtal you could maybe get a band appx 9.885 or so. And it will tune backwards. Most all drake type xtals will work in other models. I have both a r4 and a 2c and swap xtals between them. I have a boatload but unfortunatly not for sale. Drake has em cheap though if you buy the right model xtals. Price varies per model even though they will work in all. MK

Thanks. I see your point. I was thinking of (but not writing of) stubs coupled with very small capacitors. A 1/4 wave shorted stub is resonant. A 1/2 wave open stub is resonant.

>It'll hack SSB without any extras if you know how to drive
>it properly.
>
I know that, I wouldn't dare mod my RA17 either. What I meant was that
the design for the external SSB demodulator in RADCOM should be
modifiable to anything you want. If memory serves me it needed to be
hung on a few parts of the RA17 and these hooks would need altering to
suit whatever the person who originally asked wanted to do. The only
SSB mod I would use for an RA17 is the proper Racal SSB add on.

Cheers

Robin

Hello--
This book (Rhea's "Oscillator Design and Computer Simulation") in its
first edition came with a crippled version of an oscillator-design
program (STAR 2.0) which ran under DOS. The program's main limitation
was its built-in device family (11 models). However, you could "fool"
the software by editing a device's data file, keeping the device name
the same but using your chosen parameters.

ARRL Radio Designer offers a better user interface and more flexibility;
as an oscillator book, the first edition rated an "OK" but not the
five stars given in the Amazon review. Perhaps the second edition is
indeed much better.

Hmm, that is pretty different from my experience. I've built and used a couple of Rhea's designs with no problems. Your original question was "what is the normal way that varactors are used to control the frequency of an oscillator," and to that, I can only suggest that they are used in pretty much the same way you'd use a capacitor to control the frequency of an oscillator. :-| The other suggestion you've gotten re: making the relatively low-Q varactors as small a part of your overall resonating capacitance as possible, and using back-to-back (front-to-front?) diodes to avoid conduction during any part of the cycle, is a good one. Other than that, what else is there to know beyond f=1/2pi*sqrt(LC)? You just need to wire up some circuits and examine their stability, amplitude, and phase noise characteristics on a spectrum analyzer to get an idea of what's going on.

You might find the oscillator design discussions in

http://www.amazon.com/exec/obidos/isbn=0471520195

to be a little more enlightening, although Rohde might not be the best author for someone just starting out. A better alternative might be Wes Hayward's

http://www.amazon.com/exec/obidos/isbn=0872594920

...although most of his info is targeted towards HF experimenters, not microwave.

901. 10kHz to 7kHz conversion for OFF-FREQ Standard

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-22 00:00:00 UTC
From: la8ak@online.no
Message-ID: <36a7c6e0.19989799@news.online.no>
Source record: 74509

Hi

for Kalundborg 243kHz off-air standard I need a 7kHz signal to try it my way. Droitwich is quite weak here and even the Danish Kalundborg is weak. I am well aware of bit-rate multipliers, but I want to have a symmetrical signal as possible for minimum jitter.
One suggestion is to use a divide by a CD4017 divide by 10 IC, and connect outputs 1-3-5-7-9 to one switch (BC547) - 5kHz and outputs 1-2-6-7 to another series switch - 2kHz output. Connect the switches (BC547/BC238/2N3904) in series and use a simple tuned L/C-circuit in the collector output circuit. I would use 10k(22k) resistors between CD4017 and bases.
Any comments?

73
Jan-Martin
LA8AK

PS. For possible discussion I have scanned the circuit diagram to gif file, also the block diagrams for SM6ESG's circuit for Kalundborg standard and my suggested design are available as gif file

A shorted stub is resonant at 1/4 wave.
An open stub is resonant at 1/2 wave.
There is no such thing as an open 1/4 wave stub. If you try to make one, it will ignore your wishes, and it will be a 1/2 wave stub at 1/2 the frequency you were intending.

As for the series/parallel issue, I remain confused.

I like the book. Not five stars like in the comment on
amazon.com, but, say, 4 stars and worth the money.
My copy has an unusually strong tendency to be borrowed
to other people.

You could translate the simulation files easily line
by line to SuperCompact / RadioDesigner / Aplac /HP Esoft or whatever.
Rhea does quite a good job to show how to get a simulation
model for a lot of oscillator types. And this is what the
book is about, if you read the title carefully.

> One wonders if it is an advertisement for =SuperStar=.

Yes, it is. So what. Rohde's books are advertisements for
SuperCompact / Serenade / Microwave Harmonica / Synergy Microwave
and Rohde & Schwarz signal generators.
That does't make them less interesting.

Rohde: "Microwave & wireless synthesizers" has a section on VCOs, too.

Cut a few commercial VCOs open and look what's inside. That
quickly helped me to get a feeling for what they are supposed
to look like.

epoxy transistors are usually cheap compared to metal can types. Look at
Drake SPR-4, 2-C, R-4C etc, they don't use much of the special types you
refer to, wonder why amateurs select anything else than the types which
suffice in 95% of the applications? 2N3393, 2N3394 and MPS3702 are just
cheap and work satisfactorily in most circuit you may wish to try. But
2N3704 seems to have some bandwidthproblems in HF oscillators.

NPN bipolars: BFR96, BF199 and BC547=2N3904
I would not pay more than $0.07 for the VHF types, and $0.35 for the UHF
types. Used over 25 MPS918 and few hundreds MPS3394/MPS2926 25 years ago
because they were the cheapest you could get, saturation and max current
drain is usually not important, it will only increase the price.
PNP bipolar: BF324 (300MHz) and BC557 or 2N3906

BD139 (up to 30MHz TX) 2.5W RF,
JFETs: J310 and BF245, BF246, P8000
SwFETs: 2N7006 and VN10KM

> ------------------

This article is aimed towards filters, not VCOs, and most
circuits are much too complicated for an VCO.
Just take fig. 2a and imagine how many dc blocks and chokes
you need just to feed the tuning voltage to the diodes.
There will be LOTS of parasitic resonances resulting in
frequency jumps, backwards tuning and other pleasures.

One stripline and one diode/pair is usually enough for a VCO.
You may need another diode to adjust the feedback if you
want a super wide tuning range.

Sure. QST View files are just .tif graphics files, logically named,
arranged quite handily in logically named subdirectories. Open the
file for the page that contains the schematic you want to save as a
tif in a graphics program like Paint Shop Pro (http://www.jasc.com/),
process and crop it as you like, and save the resulting image as a
gif--no scanning required.

Tom, you can get them from Country Wines and Beer and numerous other places I can't remember but have seen on the 'net. Usually run about 35-40 cts US each, for new brown longnecks.

Better than scrounging, cleaning, scraping labels, hassling with different heigth bottles when capping, etc.

From Joe KF4YYA in rec.radio.amateur.antenna this very day :-

Formula for antenna wavelength is L = (c * lambda * V) / f

Where L = Physical length in feet
lambda = Electrical length in wavelengths (ie 1/4, 1/2, 5/8)
c = Speed of light (983,559,096 ft/sec, rounded to 984)
V = Velocity factor (usu. .66=coax check specs of cable)
f = Frequency in MHz.

Well, that's equivalent to 'maximum current'. But what is often significant in the operation of a circuit is maximum voltage across either the L or the C. The difference is normally only significant if Q is 10 or less, but at Q = 10 the difference is 1 %, and even modest equipment will measure frequency with a much greater discrimination than that.

You don't see Q-meters in labs these days, but the effect is significant in interpreting their results.

Well, not necessarily for 1 fF, which would require perhaps 1 turn, if that, maybe just two parallel wires. But if that were a problem, I would use Teflon coated wire for the inner and bare wire for the outer, then solder the turns of the bare wire together, or use a scrap of foil.

This is all based on the assumption that it isn't possible to get the
inductance low enough. I feel sure that ingenuity is not so easily
defeated.

Some people are reluctant to get into the circuitry of an
RA17 with a soldering iron.

Judging by the amount of original connectors I've supplied to
owners in the past two months, they want to keep them as close
as possible to the original specification.

(And if you mess the alignment up, well...you might as well
use the set for spares....!)

Hello--
you might want to try using a piece of bifilar magnet wire (two
strands of insulated magnet wire bonded together). Solder ends
to points on microstrip and then trim the stub's length.

Well I have thought of cutting out a small piece of PCB (3x3 mm) and turning it vertical and soldering it in like a surface mount chip capacitor over a gap in the microstrip. But instead I have used a tapered line impedance transformer to match my existing varactor, and to critically couple a 1/4 wave microstrip resonator. The small variation in capacitance will "pull" the resonator. Strictly speaking the varactor capacitance is not part of a tuned LC circuit, but just the coupling. The tuning range is narrow, only about 3 percent, but that is enough.

In my case very true, for no other reason than the one I've got (Mk II)
was unmodified and works quite well, if it ain't broke don't fix it sort
of thing.

>(And if you mess the alignment up, well...you might as well
> use the set for spares....!)
>
True, although I've realigned several of these and never had much
difficulty. Although I will admit that I have never touched the
critically coupled filter as I don't have the experience to dig myself
out of the ensuing mess. I have a potentially suitable wobbulator but I
havn't had the courage to set it up and try.

But then I've always started from the position of having a set that was
reasonably well aligned to start with. I don't think I would like to
start with a set that had had its settings scrambled. Although I'd have
a go if someone presented me with one.

Cheers

I think, not having tried one although if someone would lend me one I'd
love to have a go, that it would remove the need for critical balance of
the RF gain so that you could use the AGC circuits as though it was a
normal SSB rig. Though I must admit that you can do very well as you
suggest with manual gain and careful tuning. After all people did it
with AR88s for years.

Cheers

950. RFI in my Microphone!

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-23 00:00:00 UTC
From: Bob Sikes <rwsikes@mediaone.net>
Message-ID: <36AA87F6.C3EDA0C2@mediaone.net>
Source record: 74416

I have a ICom 740, which works well with the electret Icom desk microphone that came with it. But I long for a headset microphone. Unfortunately, the Icom requires a preamplifier. I purchased a headset and tried building my on preamp, but wasn't able to get adequate gain (I guess) with a one stage FET amp. Suddenly I thought of using a mike mixer as the preamp! I hooked it up and all worked fine into the dummy load, and with minimal output. But as soon as I cranked up the amp to about 20 watts, I got noise when I talked. At 100W, oscillation.

My guess is that I'm getting RFI in the preamp. I tried grounding and wrapping in chokes, but nothing helped. I would add that I'm on the second story and while I do have a ground, it's probably not great. At 100 W every cheap computer speaker in the house crackles.

Is there anything that I might try to fix this?

Bob Sikes

A 2m-band amateur radio transmits FM, while AM is required in the
aircraft band, so it simply won't work. Even if it did work, it would
be illegal.

He should look for a used aircraft band handheld. I found a used Icom
IC-A20 for $350 CDN, which is under $250 US. Any of the large heavy
aircraft handhelds should be pretty cheap, because the much smaller
cuter IC-A22 with more memories and alpha display is only $430 *new* the
last time I looked. And you can get a *new* IC-A4 for $300. So the
days of the $600 aircraft handheld are over.

Dave

AARRRRRRRRGGGGGGGGH. Will you just put the authors and titles here
instead of putting some USELESS URL.

1. Usenet is NOT the Internet, and no small number of people read
the newsgroups (or the r.a.a.h mailing list mirror) without keeping
up a direct connection. And any future use of these postings off
an archive or printed copy will be extra work if not futile.

2. Amazon is a pox upon humanity. They're bound to be keeping track
of everyone's web requests on some lists, over the use of which the rest
of us will have no control. They have obnoxious employment practices.
Their stock price vs. value is off in some alternate universe. And if
they are successful, the zero sum game of book retailing means that an
existing industry is going to die.

> about 3 percent, but that is enough.

Using pieces of dielectric for adjusting coupling between resonators and
tuning them is accepted practice in the industry. However, lay them flat,
slide them along the resonators, and when you find the positions that
work, glue them down.

Use low loss material with a high dielectric constant if you can get it.
Tiny pieces of alumina substrate with er~10 work great.

Alternatively you can use thin low dielectric constant material if you have
plating on one side. This makes a single layer capacitor that you can
cut to suit and slide over the resonators and then glue down when you
find the proper coupling.

Another technique suitable for breadboarding, is to lay down some
transparent (3M) tape over the resonators as a dielectric layer
and then use a small piece of metal foil tape on top of that to
couple the resonators.

The "gimmick" capacitor made from twisted wire is really a series open
circuit stub, as has been noted, and is not well behaved over frequency.

Don

969. 50 to 75 ohm power attenuators??

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-24 00:00:00 UTC
From: CommQuart <commquart@erols.com>
Message-ID: <78fgdk$3vm$1@winter.news.rcn.net>
Source record: 74287

First off, are these commercially produced?

I recently acquired a Boonton 42B microwatt meter that
has a few 75-ohm power sensors and one
50-ohm power sensor. I would like to use this meter to
measure RF power levels up to the 10-watt range thru
500 MHz--the basic unit is rated for 10 millwatts max.

Since the heads are very expensive and easily damaged, I
want to use the 75-ohm sensors for routine work.
figure I need three 10-dB attenuators to cover the ranges
I need. The last attenuator will need to have 50-ohm input
and 75-ohm output impedance, the problem is I can't find
any designs for 10-dB attenuators with these characteristics
(unit should be good for a least 500-mW as well). Can anyone
reference a text which shows how to design pi attenuators
having unequal input and output impedances? Can anyone
reccomend a source for decent quality resistors (monolithic)
for this project? The attenuators should be as accurate as
possible, I can probably verify to a few 10ths of a dB using
my signal generators and RF Millivolter.

Any input kindly appreciated.

suggest you use minimum-loss pad between 75 ohm the probes and the 50ohm
power attenuators, this adds some attenuation, but it is easy to make
wideband using two chip resistors.

984. Re: FM mod for FT-707

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-24 00:00:00 UTC
From: Martin John Hallsworth <Martin@g1gyc.demon.co.uk>
Message-ID: <917213929.2155.0.nnrp-03.9e98acde@news.demon.co.uk>
Source record: 74302

Hello John,
I had an FT 707 that I had SMC at Southampton add FM to
I think the design was by a G8 ???.
Worked well when transverting.
The RX side took signal at the 8.9Mhz if filter the roofing filter in the
707 RF unit
I think and passed it to a MC3357 (could use a 3359 chip or similar now)
On TX I think the audio was tapped and fed to a Xtal oscillator with Varicap
diode
across it. This signal was then passed to the TX Mixer stages (like the SSB
audio)
Sorry I can not be pin point accurate I no longer have the rig (sold it on
some 7
years back) ask SMC if they can help.

cheers martin

985. Cellphone oscillator/IF frequencies

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-24 00:00:00 UTC
From: davem@zeppo.cs.ubc.ca
Message-ID: <78g65s$1fm@zeppo.cs.ubc.ca>
Source record: 74303

I recently dismantled a couple of old cellphones, out of curiosity and looking for parts to scrounge. They are Audiovox and MEI handheld models. One thing that puzzles me about them is the apparent first IF frequency.

Since cellphones are full duplex with a 45 MHz offset between Tx and Rx frequencies, I expected that they would synthesize the TX frequency with a PLL and also use this as the first local oscillator in the receiver. This would give a first IF frequency of 45 MHz while requiring only a single VCO. Then I'd expect to see a crystal of 45.455 or 44.545 MHz for the second oscillator, giving a second IF of 455 kHz.

But that doesn't seem to be what these phones do. In one, the first IF filter is clearly labelled 83.160 and the crystal for the second local oscillator is 82.705. So the second IF is 455 kHz as I guessed, but where does 83.160 come from? In the other phone, the frequency of the first IF filter isn't marked, but the second oscillator crystal is again 82.705, so it seems to use the same set of frequencies.

I can't find any sign of a second VCO to operate at 83.160 MHz away from the receive frequency (which would be either 128.16 or 38.16 MHz from the transmit frequency). Can anyone explain what is actually used as the first local oscillator frequency, and how a difference of 83.160 is produced?

Dave

By the way, both phones have nice little TCXOs in them. One is 15.36 MHz and one is 12.0 MHz, which would be divided by 512 and 400 respectively to get the 30 kHz reference frequency needed for the AMPS channel spacing. Too bad that 10 MHz isn't a multiple of 30 kHz - no chance of finding a nice 10 MHz TCXO for upgrading frequency counters with. On the other hand, NAMPS uses 10 kHz channel spacing, so NAMPS phones are a better bet for oscillator scrounging.

Why do expensive amateur handhelds still use plain crystals for the master oscillator, while cheaper cellphones all seem to use temperature controlled oscillator modules? They can't be that expensive given what cellphones cost these days.

Dave

Martin, Thanks for the info on the FM mod.
I have been offered a 707 cheaply.
It does 80 through 10 with the new bands,
no 160 though have you or anyone else,
heard of a 160 mod for the FT-707 ??

987. HF solid state 300w amp

988. ARRL Radio Designer - Bug ???

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-24 00:00:00 UTC
From: Bert Douglas <bertdNOSPAM@dibbs.net>
Message-ID: <_vNq2.2299$Si1.1719439@news2.mia>
Source record: 74306
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

Hi again,

I seem to have discovered a bug in ARRL Radio Designer, but I am not 100% sure. Perhaps I am not running it properly. I am hoping someone can give me some confirmation.

The model for transmission lines does not seem to give correct results, especially when one end of the line is connected to node zero (ground). Here are two circuits that should give very similar results, but they do not.

```
BLK
TRL 0 1 0 0 Z=20 E=20 F=2.44 A=0.8
CAP 1 2 C=5PF
TEST1: 1POR 2 0
END
```

```
BLK
IND 0 1 L=0.5NH
CAP 1 2 C=5PF
TEST2: 1POR 2 0
END
```

The 20 ohm 20 degree shorted transmission line is supposed to be an approximation of a 0.5 nH inductor.

In Puff these two circuits produce nearly identical Smith Chart plots. The plot is a semicircle with radius close to 1 (right at the outside edge).

But in ARRL Radio Designer the plot spirals toward the center with higher frequency. I am sweeping frequency from 0.1 to 6GHZ. For kicks try setting the attenuation to zero in the above example. You will get a screen full of numerical hash.

Thanks for the help,
Bert

989. Vandenberg AFB Launch Schedule

Delta II Still Sitting On Pad

The launch of a Delta II missile carrying the ARGOS, Orsted, and SUNSAT satel-
lites from Vandenberg AFB has now been postponed several times due to upper
level winds.

Another launch attempt may be made on Tuesday, January 26th at 02:35:33 PST
(10:35:33 UTC). The launch window will run from 02:35 to 02:45 PST.

Weather permitting, the event should be visible over a wide area, perhaps as far
away as Las Vegas and north central Arizona.

For current launch status, call the Boeing Delta Launch Information Hot Line at
714-896-4770 and the 30th Space Wing Public Affairs Office at 805-734-8232 ext.
63595. The Public Affairs Office will be manned on launch day from 01:30 to
03:30 PST.

Vandenberg AFB Launch Schedule
As of Friday JAN 22 00:30 PST

Launch
Time/Window Launch
Date (PST/PDT) Vehicle Comments

JAN 26? 02:35-02:45 Delta II Payload is ARGOS, Orsted, and SUNSAT
satellites

FEB 10 00:01-06:01 Minuteman III ICBM test launch (non-orbital)

FEB 26 18:52-19:03 Pegasus XL Payload is WIRE satellite. Missile will
be launched from aircraft staged from
Vandenberg AFB

MAR 01 Unknown Delta II Payload is Iridium satellites

MAR 09 00:01-06:01 Peacekeeper ICBM test launch (non-orbital)

MAR 31 20:59-21:08 Pegasus XL Payload is TERRIERS satellite. Missile
will be launched from aircraft staged
from Vandenberg AFB

APR 07 Unknown Titan IV Classified payload

APR 15 Unknown Delta II Payload is Landsat 7 satellite

MAY 01 Unknown Pegasus XL Payload is TSX-5 satellite. Missile will
be launched from aircraft staged from
Vandenberg AFB

MAY 12 01:01-07:01 Minuteman III ICBM test launch (non-orbital)

JUN 14 17:30-23:30 Minuteman II Missile defense test. Vehicle will send
simulated warheads downrange. A second
missile will attempt to intercept the
simulated warheads.

JUN 23 01:01-07:01 Minuteman III ICBM test launch (non-orbital)

JUL 01 23:00-24:00 Taurus Payload is KOMPSAT satellite

JUL 08 Unknown Pegasus XL Payload is ORBVIEW-3 satellite. Missile
will be launched from aircraft staged from
Vandenberg AFB

If a launch window is given, an attempt will be made to launch at the start of the window. If a problem is encountered, the launch could be delayed and occur at any time in the window, or be rescheduled for another day.

The above table was compiled from unclassified information obtained from Vandenberg AFB.

Shortly after sunset on December 5th, NASA's SWAS satellite
was launched from an L-1011 flying off of the Central Coast.
The following news release from the Harvard-Smithsonian
Center for Astrophysics describes the first scientific
results from this mission.

FIRST RESULTS FROM SWAS INCLUDE SOME SURPRISES

Water, Water Everywhere: New NASA Satellite Finds Stellar Nurseries to be Hot and Humid

AUSTIN, TX -- With nearly flawless execution in both its launch and early operations, the Submillimeter Wave Astronomy Satellite, or SWAS, has already produced some exciting results, including the discovery that large amounts of water seem to saturate the interstellar medium, while, by contrast, molecular oxygen cannot be found.

Launched from a Pegasus XL vehicle on December 5, 1998, SWAS is the first space borne observatory to operate at submillimeter wavelenghts, a narrow band of emission lying between infrared and radio on the electromagnetic spectrum.

In only two weeks of observations, SWAS seems on target for achieving its main goal: to study the molecular clouds in space, those giant star-forming regions like the one from which our Sun and Solar System were born.

The news that excites astronomers most is that SWAS has found water almost everywhere -- and molecular oxygen apparently no where.

"We have seen water in the interstellar medium before, but only in hot regions," says principal investigator Gary Melnick of the Harvard-Smithsonian Center for Astrophysics. "SWAS, on the other hand, has found water in much cooler regions, and that's important because most of the interstellar medium is cold and that may mean that water is in a lot more places than we knew."

Equally exciting and revealing, SWAS has so far seen no molecular oxygen in the interstellar clouds it has observed. In just two weeks of science observations, SWAS has set the most stringent limits to date on the amount of molecular oxygen in star-forming clouds. The apparent absence of oxygen may actually help astronomers pinpoint the age of those molecular clouds.

"Molecular clouds are like chemical laboratories," says Melnick. "Our theories tell us oxygen won't appear until the cloud reaches a certain age. SWAS, in its future observations, will help us test those theories and determine more about these star factories."

Melnick and his colleagues are also looking forward to using SWAS to create large-scale maps of different molecules in space. Unlike water and oxygen, astronomers already know that carbon molecules, including carnon monoxide, are abundant in the galaxy. SWAS will be able to make maps of warm molecules across vast swaths of the sky -- something that is nearly impossible from ground-based facilities.

With its ability to conduct pointed, high-spectral-resolution observations of molecular clouds that are either sites of ongoing or future star formation, SWAS may also be able to answer some basic questions: 1) Where is the oxygen hiding?; 2) How do collapsing clouds cool so they can form as stars and planets?; and, 3) What is the internal structure of the clouds?

In addition to the Harvard-Smithsonian Center for Astrophysics, the SWAS project also includes contributors from the University of Massachusetts at Amherst, Cornell University, Johns Hopkins University, NASA Ames, and the University of Cologne in Germany.

Put a TRF ahead of the TRL. Use a 1:1 turns ratio and float the bottom end
ofTRF secondary and the bottom end of the input of TRL. This problem has been
noticed before. This should fix the problem:

```
BLK
TRF 1 2 0 3 N=1
TRL 2 4 3 0 Z=20 E=20 F=2.44 A=0.88
CAP 4 5 C=5PF
TEST1:1POR 5 0
END
```

Correction. Should be TRF 0 2 0 3 N=1

Hams are allowed to modify radios ... but:
Only for use by a radio amateur.
Only inside their allowed frequency ranges.

Therefore, the modification your friend thinks of is simply illegal.
But, hey, ham equipment is not *that* much cheaper ...
And, your assumption is right: Air radio is AM.

Cheers,

Most are ok as long as you choose the smallest physical sizes. Given a
choice, a single-sided re-flow termination might be better than a wrap-around
termination.

Alex I can't help you; but, discovered that I could only work my solid state kit at two thirds of the rated output without burning out the transistors; even with two muffin fans mounted on top of the heat sink. Which means your rig is probably "safe" at 200 watts for sustained operation. I have a 600 W kit with two 300W boards in it and run it safely at 400W and even more safely at 300W. You can build a "filter" kit that will work on each band, etc. to make it more stable. I have one that was built for me. If you strike out on getting help, let me know and I'll put you in touch with the guy who built my kits.

I haven't had any problems with those Digikey and Mouser chip resistors up
to 3.4 or even 5.7 GHz with transverters I've built.

The person to ask about it would be Steve, N2CEI at Down East Microwave.
He probably has the resistors you need, too. He's been very helpful to me.
I don't have his phone number handy, but their website is
www.downeastmicrowave.com.

(Note - I have no connection with them aside from beig a happy customer.)

I've got an Icom 2000 50w FM rig in the car that I'd like to use to work RS-13 in mode A, thats 145.965 up CW. While I can probably get away with not changing the transmit freq it doesn't make it very easy. Any Icom specialits out there with thoughts of changing the TX freq +/- 5 KHz? variable.

I haven't even looked at the schematic yet but was thinking about a varicap diode tapped into the LO and using a pot to swing it up and down. Can someone give me a sanity check on this? Am I headed in the right direction or is there a better way?

Tim

I recommend PADS. It's a full-function commercial package. The demo version,
called padsdemo, has limited the number of parts you can put on one board, but
I've never run into that limit with hobby stuff. It autoroutes, but you don't have

to use it. Has a lot of stuff in the library, which is easily extensible.
It's a DOS program, but runs in a win95 window.
Can output to a laser printer, but I use a sharpie in a flatbed plotter and plot
right on the
copper.
You can find it on many sites as "padsdemo".

Both of the cellphones I bought for parts have dual VCO's. I should have kept the model information before I took them apart. In all four cases they are little modeuls and are actually marked "VCO". In both units the VCO's are on the same board along with the receive mixer and what must be the prescalers. On one, the VCO's are different, and one is marked "T-VCO" and the other "R-VCO". From the other cellphone, the VCOs are identical in package but have slightly different numbers; on the boards they are designated in silk-screen ""TX-VCO" and "RX-VCO".

I've assumed that this must be standard, and that the offset from transmit to receive is done in the programming of the synthesizers.

Both the phones had IF's in the 80MHz range. I don't have one of them handy, but the second cellphone (it's IF is on the same board as the VCO's etc) has an 87MHz IF (and the second IF is 455KHz; both the second filters are marked with 455 and the conversion crystal works this equation).

Before I got the first one, I did rather expect a 45MHz IF, which I admit would be a little handier for using the first filter as a roofing filter. Perhaps in the early days the designs were simpler, and used 45MHz IF's and a signal VCO? And then they decided a more complicated design was needed?

But that doesn't explain your missing other VCO. Have you looked over all the boards? Perhaps it's in a different place?

> By the way, both phones have nice little TCXOs in them. One is 15.36

>
I've wondered about the TCXOs in cellphones. Obviously they can't cost the manufacturer too much if they are being put in these. Does that mean they aren't particularly good? Because cellphones doe seem to be a cheap source of TCXO's
.
Both of the cellphones I took apart had 15.36MHz TCXOs. One could use it in a frequency counter as long as you included the divier chain.

Sorry, Mark, gotta agree to disagree on this one. Anyone who can't look up a simple URL is nothing more than roadkill on the 'information superhighway.' I'd suggest changing your way of accessing Usenet to one which conforms with modern standards. Believe me, the ability to dereference a URL at will is worth the $20 a month it costs (in the US, at least).

Besides, in my understanding at least, ISBN numbers are not going away anytime soon. Even if you can't follow the URL itself, or if you are a conscientious Amazon objector, the "isbn=" part of the link should be easy to check out at any conventional bookstore or library. If it isn't, again, I'm sorry, but that's more your problem than mine. My advice was clearly worth exactly what you paid for it....

> an equivalent parallel resistance of 772 ohms and an equivalent parallel
> capacitance of 3.3 pf ??

I will assume a frequency of 10MHz, since you did not specify.

The 770 ohm, 3.3 pF load is difficult to plot on a 50 ohm Smith chart, so we will normalize the chart at 500 ohms and assume a freq =10MHz.To access the Circles Utility, make up a "dummy" circuit file as follows:

```
BLK
RES 1 2 R=50
TEST1:2POR 1 2
END

FREQ
10MHZ
END
```

Note that the FREQ block contains the desired frequency.

The task is to locate the load on the chart and also locate the 50 ohm point that you want to match to.

The normalized load conductance is G = 500/770 = 0.649
The capacitive reactance is 4823 ohms therefore:
The normalized load susceptance is B =500/4823 = 0.1037
On the chart, draw a G=0.649 circle
Draw a B=+0.1037 circle
Draw an R=50/500 = 0.1 circle. It intersects the horixontal axis at 0.1 + j0 ohms

You now have the load admittance at the junction of the G and B circles and you have the 0.1 +j0 goal. You can now design a wide variety of networks that go from the load to 0.1 ohms.

After you get the network that you want, modify the dummy circuit file with the values that you want, after you calculate the L and C values. You can also use transmission lines. Keep in mind the 500 conversion factor when doing all of this.

I will now e-mail a picture of the Circles chart to you in PDF format. You can read it using Acrobat Reader.

> to resolve SSB?

The Australian design you are discussing may be the one I published in "Amateur Radio" in March 1998 - I don't know if it was reprinted anywhere or what the one in RadCom was.

A few comments:

1. My design did not involve any mods to the RA17 other than wrapping a bit of wire around a tube pin and bringing it out. Certainly no soldering was involved.

2. It's true that you can listen to SSB on an unmodified RA17 but it does involve juggling the RF gain and AVC to get a (barely) passable result. My design is completely transparent in the sense that you tune the radio as you would any other more modern set leaving the AVC on and other controls alone. It also acts as a synchronous demodulator on AM.

3. If the "native" RA17 was so great on SSB, why did Racal go to the trouble of producing a SSB adaptor at all? I'd love to have one but they are pretty rare down here.

4. The design can be adapted to most other boatanchor receivers.

The graphs of MZ11 and PZ11 are incorrect on ports with negative resistance.

As one example: at negative 150 ohms, it displays positive 1500 ohms. The phase is wrong too. But there appears to be no obvious relation to the correct value. The graphs of S11 and RZ11/IZ11 are correct however.

1015. Help >> PCB/PWB Layout Software Suggestion

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-25 00:00:00 UTC
From: wb4lnm@aol.com
Message-ID: <19990124230342.05426.00002445@ng-fu1.aol.com>
Source record: 74317

I'd appreciate folks experience with PWB layout software that is in the "affordable" range for ham use.

I only need to do simple boards with manual routing and at the most two sided, but probably single sided is fine. I have looked at all of these and none appear to be RF friendly:

Express PCB
Eagle
Easytrax
Traxmaker
Cadint

The closest thing I can find so far to my needs is CIRCAD, which appears to be a DOS program although it seems to work ok in Win95.

I will, at most have one or two DIP packages, with most of the rest being TO-92, SOT surface mount, or RF power transistors (need to have the capability to layout microstrip lines). Want to be able to print a 1:1 output on my HP laserjet printer for the iron-on transfer method to PWB material. Manual routing is mandatory. I don't want autorouting.

Anyone who has any suggestions, I'd sure like to hear it. Please reply here or to WB4LNMxx@aol.com (remove the xx before mailing). Thanks and 73

Thanks a lot. I will try it tomorrow. I suppose it is possible to make a
"wrapper" circuit that I can use everywhere instead of TRL.

Is there a list of known"fixes" like this for ARRL Radio Designer?

Bert

1018. ANTI-CW people are liberals and would want to see Clinton go free too!

No-Code whiners are liberals. They don't like something so they trash other people to make themselves feel better. The ARRL is BOD is also full of liberals. Their restructuring proposal is just a membership drive aimed at liberals. Liberals always have their hand out waiting for someone to put something in it for free. That is why they like the ARRL proposal too. They can get something they don't have to work for.

>possible, I can probably verify to a few 10ths of a dB using
>my signal generators and RF Millivolter.

Several people have mentioned minimum loss attenuators but none have listed the component values for these. What they are talking about is the fact that for any ratio of the impedances to be matched, there is a minimum attentuation that can be achieved with realizable components. The general formula is:

Kmin = 2*Z1/Z2 - 1 + 2*SQRT(Z1/Z2 * (Z1/Z2 -1))

where: K = power into network/power out of network, a ratio - not decibels
Kmin = minimum value of K for a realizable network
Z1 = higher impedance to be matched, ohms
Z2 = lower impedance to be matched, ohms

For the case of Z1 = 75 ohms and Z2 = 50 ohms, K = 3.732 or 5.72 dB. Any amount of attenuation in excess of this can be obtained.

To design an attenuator, you can go with either a "Tee" arrangement or a "Pi" arrangement. I'll cover the T-network first. Since I hate to draw ASCII schematics (and get questions from people who do not use fixed width fonts), allow me to verbally describe the network. The T-network has two series resistances and one shunt resistance. Call the series resistor connected to the higher impedance R1. The shunt resistor is R3, and the series resistor connected to the lower impedance is R2.

R1 = [Z1 * (K+!) - 2 * SQRT(K * Z1 * Z2)] / (K-1)

R2 = [Z2 * (K+!) - 2 * SQRT(K * Z1 * Z2)] / (K-1)

R3 = 2 * SQRT(K * Z1 * Z2) / (K - 1)

If you substitute in the minimum attenuation value, R2 = 0. The other two values are R1 = 43.3 and R3 = 86.6 ohms. For all higher attenutations, R2 will have a positive value. In cases with Z1 = Z2, then R1 = R2 and the conventional equations may be derived.

Likewise a Pi-network could be used. This has two shunt resistors and a series resistor. Calling the shunt resistor connected to the higher impedance load R4, the series resistor R6, and the shunt resistor connected to the lower impedance load R5, the following equations apply:

R4 = [(K - 1) * Z1 * SQRT(Z2)] / [(K + 1) * SQRT(Z2) - 2 * SQRT(K * Z1)]

R5 = [(K - 1) * Z2 * SQRT(Z1)] / [(K + 1) * SQRT(Z1) - 2 * SQRT(K * Z2)]

R6 = (K - 1) * SQRT(Z1 * Z2 / K) /2

Again substituting the minimum value for K, R4 is infinite for Z1 = 75 and Z2 = 50. R5 = 86.6 ohms and R6 = 43.3 ohms respectively. But naturally in the minimum attenuation case the networks are identical. Also if Z1 = Z2, then R4 = R5.

It may not be obvious to everyone until they play with the number some, but there is some beautiful symmetry in these equations.

I pulled these equations from a spreadsheet I wrote to calculate such values. I was interested because I had an old signal generator with a 600 ohm output impedance and I wanted 50 ohms. In this case Kmin = 45.98 or 16.62 dB. I went with a ratio of 100 or 20 dB to make converting the signal generator output voltage easier. You will probably want to do the same using either 6 or 10 dB. I think I found the original derivation in Everitt's "Communications Engineering" from around 1935 or so.

As for resistors, I would use noninductive chip resistors if you want UHF operation. For low HF, metal film resistors should work fine [their inductance is much smaller than you might think].

IIRC "shortwave magazine" carried a few articles on FM and 160m mods.
the 160m mod was certainly not for the faint hearted. it used the blank
position on the bandswitch between 10m band D and 80m.
for FM tx the mod was put on the RIT varicap, having previously been
suitably limited and filtered, the rx side was, i think, a MC3359 ?, taken
from somewhere near the IF filter.
good luck..

I'll take this one.

Thank you for writing. It's all true. CW is representative of the old captialist/conservative system, popular among angry white males, that emphasizes acquisition of licenses to operate a station much as he oppresses women and minorities on his non-ham life. We of the United Conspiracies believe it is time for a new age in communications, not governed by so-called standards such as Ohm's Law and other scientific principles named after dead white European males.

We propose a class-based system where the have-nots can modify standards to compensate for the generations of oppression at the hands of the techno-fascists. We realize this will distress the privileged elite, but the inevitable march of history cannot be stopped. Eliminating code requirements are only the beginning. Soon there will be a speech code enforced. Many on this group are making statements that create an atmosphere of hostility toward those in government who are trying to implement the New Radio Order. The American People will not tolerate this (polls show), and we will put a stop to it.

Wishing you a good seat at the re-education center, I remain

There's a reason why the ARRL has offered a restructuring proposal: Amateur Radio is dying. This fact is evident by looking at the decline of new amateur licenses being granted. Also, the median age of hams is getting significantly older. The ARRL figures that by doing away with the code requirements, it will attract more people to the hobby.

Why is Amateur Radio dying? Because people such as yourself are carrying on a "holier than though" attitude towards those who don't yet know the code. Your attitude disgusts them, and they have no desire to become what you already are. So, if people such as yourself would drop the no-code issue, and be a bit more welcoming towards ham prospects, perhaps there would not be a need for the proposal.

Morse Code is in no way related to Clinton. Which brings me to my next point: Memorizing Dits-and-Dashes (which is very easy to do with a program such as CodeQuick) does not make an Amateur Operator more knowledgeable about the hobby. It just allows the operator to communicate via another communication method.

Finally, your posting describes how No-Codes "trash other people to make themselves feel better". Well, what do you think your entire posting just did? It's almost as if you are upset that you ever learned the code. Now, you are just upset that others might not have to go through the "initiation" to get into the hobby, like you did.

I support Morse Code and am currently studying it so I can upgrade my license. In my opinion, a 5 wpm requirement should at least be kept. Code has been proven to be superior to other types of communication in times of necessity, so it would be preferable if the majority of hams knew at least 5 wpm. The reason I posted this message was because the attitudes of "Code-Enthusiasts" is really degrading to amateur radio, a hobby in which good-will is supposed to be so evident.

>

Can't say about the oscillator frequencies without seeing the units, but as far as the cost of cell phones....

If you went out and actually tried to buy a phone on the open market you would see just how expensive they are!

Why they are marketed at 99 cents (or even free in some cases) is that the cell phone company quickly makes the difference up in the monthly usage charges. Basically they give you the phone knowing that you will give them your wallet every month.

Can you say 'loss leader'?

Now if we all sent $5 to the ARRL every time we used the local repeater, then maybe we could all get dual band HTs for 99 cents!

Since I no longer work for a cell phone company, I can say this:

If you are considering getting one, ask for a refurbished Motorola MicroTAC. They are the most dependable. (That is for 'normal' 800 MHz---don't know about digital or PCS) Figure how much you can afford each month, and look for a contract that is that amount (for so many minutes per month), then _watch_your_usage_time_!!

1031. Re: 50 to 75 ohm power attenuators?? - make a 10 dB matching Att first....

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-25 00:00:00 UTC
From: Jim <I.hate.SPAM@nospam.com>
Message-ID: <78i2u2$ffb@sjx-ixn9.ix.netcom.com>
Source record: 74333

I'd be inclined to make a 10 dB matching attenuator and then do all the
rest of the attenuation with standard 50 ohm attenuators. This would keep
the scales on the meter on the 10 dB marks, you just add 10 dB to the
reading to get the actual value.

75 Ohm -------------------- 91 ohm --------------------- 50
ohm load
P'meter | |
| |
| |
200 ohm 75 ohm
| |
| |
Gnd Gnd

10 dB 75 to 50 ohm attenuator.

---

75 Ohm -------------------- 43 ohm --------------------- 50
ohm load
P'meter |
|
|
91 ohm
|
|
Gnd

5.72 dB minimum loss 75 to 50 ohm attenuator.
This is as low as you can get for attenuation
while
matching 75 to 50 ohms.

As you can see, it will make the power meter
reading
so that you'd have to add 5.72 dB to whatever the
meter
reads to get the actual value.

1036. SMD resistors for GHZ frequency?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-25 00:00:00 UTC
From: Bert Douglas <bertdNOSPAM@dibbs.net>
Message-ID: <Q71r2.2168$oi.2159134@news3.mia>
Source record: 74338
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

Are all SMD resistors the same? Do the normal ones you buy in DigiKey work ok in the 2.5 GHZ range?

All it says in Digikey is "thick film", with no further data.

1037. Re: spectum analyzer build

I have some of these units, but have not finished the project yet.

One of the things I am considering is to use the TV tuner non-swept and sweep at the IF. I beleive most of them have an output around 45 MHz. The swept oscillator would then have to go from 55.7 to 60.7 MHz, for example, and would mix the 45 MHz to 10.7, where crystal filters would be used.

The advantage of this is that the TV tuner could then be phased locked. The disadvantage is that an extremely wide band sweep would not be possible.

This is basically what used to be called a 'panoramic receiver' instead of a spectrum analyzer.

S.E.E. discontinued their picture stick 2 years ago - I now want to buy one. Any one have one one?

it is a scanning led display

a little pic computer chip flashes a series of 16 diodes that are mounted on a stick.

by physically waving the stick around, one can see a 2 dimensional picture or text display.

any alternative ideas from any of you smart guys out there?

(I fly radio controlled helicopters - I though it would be fun to fly at night - and see a moving picture on the "swept out" rotor !!)

this is similar to stamp application #14
ftp://ftp.nutsvolts.com/pub/nutsvolts/library/stampaps/st_ap14.pdf

Perhaps it would be possible to construct a variometer type of
arrangement with power cores or moving a bundle of ferrite bars (ex
MW radios?) in/out 2 inductors

Ferrite bars ex MW radios however might cover only a limited freq range .

Good Luck

> --Don
==========
Don, I have 2 of those (motor driven) units , from Collins
auto-tuners out of an aircraft installation.
Both drums have a diameter of approx 3.5 inches.
According to Peter, G3RZP they are meant for a '100 Watts' job.
It would be an elegant solution to a PI tank .....but perhaps
not for RF power ratings much in excess of 100 Watts

The Collins tuners were not that long ago available from a surplus
equipment/components supplier :
Birkett - Lincoln ,England and also contained a motorised
1000pF-3000 V variable Jennings vacuum cap , a Jennings vacuum relay
,a motorised low power roller coaster inductor and a bunch of high
quality hermetically sealed relays. Birketts' advertises in RSGB's
Radcom. Their prices are somewhat more modest than those at Surplus
Sales of Nebraska.

Hmmm I'd like one of those myself, I built a sine wave "wand" in High School using a 555 timer and 4017's cascaded to drive about 20 led's when you waved it you could see a sine wave. Not nearly as impressive as a Picture Stick however!

The hand writing is on the wall, and I suspect (IMHO) that at the next WRC the requirement for any kind of code test will finally be dropped for any radio operator including ARO's!!

I got into Ham Radio because of the NO-CODE Tech class license. Learning the code takes a lot of time that I just don't have right now. I work a full time job as an Electrical Engineer and I take classes at night (I'm 42 so I'm no kid) to finish up a degree in Math/Computer Science. Now for the record, I am getting a degree in computer science just for the hell of it, nobody twisted my arm to do it. I like computers as a hobby so I decided to get the degree. What I don't need is someone twisting my arm to take a Morse Code test for a mode I currently have zero interest in using. I don't have a problem with taking any tech exams, but singling out CW for special treatment (operator filter, gateway, hazing rite etc.), get a life! When and if I ever want to use CW I know that I will study and learn the code and will do a proper job of it. So if the FCC wants to take away my no-code Tech licensee (the PRO-CODERS dream come true), that's fine, I'll spend my money on a new computer instead of a new radio and get onto the Internet. Then I'll sit back while the membership of the ARS dwindle, the FCC sells off the Ham Bands to the highest bidder and smile.

There are more that you may suspect (Tech NO-CODES) who are more qualified to operate a radio than some of the smug PRO-CODE Extras I see posting in this NG. Just because we don't have that elite licensee class does not imply we are a bunch of lazy good-for-nothing dumb hicks.

Oh yes, Clinton has nothing to do with this thread.

Gee, you're a busy guy. You're so busy, one has to wonder how much time
you have to actually OPERATE. After all, you're SOOOOO busy that you can't
learn morse code, you must be SOOOOOO busy that you can't get on the air
and operate 2 meter FM on a repeater, right?

>I don't have a problem with taking any tech exams

Well, gooooool-leeee. Wonder why not? Maybe 'cuz you already KNOW all that
material, so don't have to expend an erg of energy to actually get a ham
license in that manner?

While there does seem to be more rude people on the air today than in the past, it is not the main reason for the numbers problem. There are simply many more intresting things to do using other media that require no entrance exam. When the code test is finally gone, and the written test is reduced to simple regulations, you may be surprised to find how few will rush forward to become hams...

Anyone has a schematic or know where I could find some information to build
a 6M J-Pole antenna made from 300 ohm TV twin-lead?

Thanks
Daniel

YES: If you have very little practical experience in servicing rigs
NO: Many of us don't aren't so much afraid of a practical challenge,
may of us can even calculate the influence on the circuits of planned
modifications. A friend of mine had to rewind some damaged 76kHz IF
transformers and RF coils for his German warship size receiver Lw.E.a,
the worst problem is that the trimming capacitors are only 5-20pF - some
on longwave (!), basic knowledge in radio and you have to calculate
tuned circuits is a must, but many of us have never found it to be too
much challenge.

All resistors are not created equal. SMD resistors come trimmed two ways, plunge cut and edge trim. The plunge cut induces more self capacitance; edge trim is better for high frequencies. Note that the amount of trim (and hence amount of capacitance) will vary with lot. Digikey probably doesn't have a clue about this.

Unfortunately, I don't have a supplier handy. If you can't find one, let me know and I'll dig one up. It is fairly likely that Precision Resistive Products (www.prpinc.com) makes them; I do know that they make a non-spiral trimmed (buffed) leaded metal film resistor for high frequency use.

Greetings Hobbyists:

Did you ever play that game when you were a kid where you take the significant words out of a story and let the people in the room pick new nouns and verbs etc. without them really knowing what the story is? It turns out all goofy and funny. That was the twisted frame of mind I was in when I read this post, and decided to have fun with it.

If you just substitute a few words for Dan's flame, it casts an entirely different light.

P.S...This is not an attack on Dan, but his writing style is easy to work with.
P.S.S...I really no longer give a rats #!*%& what happens with the code issue. Why should ham radio be any more noble that the society at large?

Dan Starkenburg wrote:

>
> --
> Dan Starkenburg - kc0eao
> dan.starkenburg@cwix.com

There's a reason why NAMBLA has offered a restructuring proposal: Pedophilia is dying.
This fact is evident by looking at the decline of new marriage licenses being granted. Also,
the median age of boys is getting significantly older. The North American Man Boy Love
Association figures that by doing away with the age requirements, it will attract more
creepy old men to the hobby.

Why is man boy love dying? Because people such as yourself are carrying on a "holier than though" attitude towards those who don't yet know the ecstasy. Your attitude disgusts them, and they have no desire to become what you already are. So, if people such as yourself would drop the young age issue, and be a bit more welcoming towards our prospects, perhaps there would not be a need for the proposal.

Man boy Love is in no way related to Clinton. Which brings me to my next point: Memorizing Sex Crime Laws (which is very easy to do with a program such as BoyQuickie) does not make a Boy Lover more knowledgeable about the hobby. It just allows the pervert to molest via another molestation method.

Finally, your posting describes how NAMBLA members "trash other people to make themselves feel better". Well, what do you think your entire posting just did? It's almost as if you are upset that you ever learned to live straight. Now, you are
just upset that others might not have to go through a ï¿½complete moral collapse" to get into
the hobby, like you did.

I support Man Boy Love and am currently studying it so I can get my marriage license.
In my opinion, a homosexual requirement should at least be kept. May Boy Love has been
proven to be superior to other types of sex in times of necessity, so
it would be preferable if the majority of perverts knew at least one child. The reason
I posted this message was because the attitudes of "heterosexuality" is really degrading to NAMBLA, a hobby in which good-sex is supposed to be so
evident.

Wrong, I'm on the radio while driving to and from school from home/work. Now how would one work a code key while driving down the expressway at 65MPH? What does CQ sound like in Morse Code while driving over pot-holes? ;-))

You sound pissed off to me. I probably worked harder than you did. Four years of engineering school and another 18 years working in the power electronics field. What did you do? Sit down and high-lite all the correct answers in the study guide, then spend a weekend or two committing them to memory (I really know somebody who did this), then rushed out to take the exam before you forgot most of it? Anyway, I don't care how you got your license. If you have a problem with how I got mine, well it's YOUR problem to deal with, not mine.

Bert,

ordinary cheapie 1206 and smaller smt resistors are fine at 2.5 GHz, as long as the range is reasonable... say 10 ohms to a K or two (parasitics get bad beyond these rough limits). The smaller sizes (0805, 0603) behave closer to ideal resistances at higher frequencies. For really high frequencies, planar resistors (ends metallized on one side only) are better, but 2.5 GHz isn't too demanding.

A 50-ohm 0805 'digikey' resistor at the end of a matched microstrip trace is a decent terminator for a 30 picosecond (12 GHz) signal.

Make sure the PCB traces are proper matched impedances!

John

>your wallet every month.

>Can you say 'loss leader'?

I can see how that works for people signing contracts. Many analog
phones can be had for free with a contract.

But I recently got a Motorola DPC 650e as part of a "pay as you go"
offering from the local B carrier. Total cost was $130 CDN, which
included $60 worth of airtime. Of course, the airtime doesn't cost the
carrier $60, but if the wholesale cost of the phone was more than $130
CDN (about $85 US), they lost money.

There is no monthly airtime fee, no monthly system access fee, no setup
fee other than what's included in the cost of the phone. There is no
contract - I might never buy more airtime. And the phone is not locked
in any way - in fact when I bought it the carrier ID wasn't even
programmed. So once I use up the airtime included with purchase, I
could immediately switch to another carrier (or use two in parallel -
it's dual-NAM), never spending another cent with the carrier I bought
it from.

And if I do continue with the carrier I bought it from, airtime is $0.40
per minute but there is no monthly minimum, other than the need to make
one call every 90 days to keep the account active.

Anyway, this phone can't cost much more than $85 US for the local
carrier to buy in bulk, and even less for Motorola to manufacture. Yet
in most respects other than power output, it's considerably more
sophisticated than any single-band amateur HT. The TCXO is only part
of that.

Nobody's arm should be twisted... and I doubt seriously that "Code" will be a requirement for all amateur license classes ever. Code is fun once you learn it... when you have the time.. when you have the desire...

I think a few "rabid" individuals are trying to speak for so called "code enthusiasts"... well... ahem... they are not speaking for all of us.. I enjoy code, ssb, fm, etc... I will defend to my best ability your right to enjoy amateur radio as you see fit... I just wish that everybody would get off their soapboxes and get back to spirit of amateur radio.

1067. Help--ARRL Radio Designer- Circles utility

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-25 00:00:00 UTC
From: Derf Henderson <ke4ros@bellsouth.net>
Message-ID: <36ACFDDC.574FC1E8@bellsouth.net>
Source record: 74369

Hello all,
Can anyone give some guidance on setting up a 2 port network to use with the Circles utility to model a matching network for a load consisting of an equivalent parallel resistance of 772 ohms and an equivalent parallel capacitance of 3.3 pf ??
Using paper Smith Chart, pencil, calculator, etc, I can solve for the value of needed inductance and capacitance and determine if they should be in parallel or series to the load and in what configuration. BUT I am unable to do the same in the Circles utility. In particular, I can't figure out how to make it a 2 port network - I can only come up with a one port which circles doesn't like. Also, I am trying not to make any assumptions concerning the configuration of the needed matching components (ie series or parallel inductor or capacitor) like I do when working with paper Smith Charts.-I let the Chart do the work.

I'm rather new to the ARRL Designer, so be kind (hi hi)

thanks
Derf KE4ROS

All of the above is true, but it may be a little confusing. Yes, the dot-time in milliseconds is 1200/wpm. However, in a string of dots, each is followed by an equal silent period, so that at 12 wpm the total interval from the beginning of one dot to the beginning of the next is 200 milliseconds.

From THE RADIO AMATEUR'S HANDBOOK (ARRL), 1971edition:

"..... the code speed can be found from

Speed (w.p.m.) = (dots/min)/25

E.g.: A properly adjusted electronic key gives a string of dots that counts to 10 dots per second. Speed = (60 X 10)/25 = 24 w.p.m."

Thanks, Bill
--- this almost seem too simple. I was evidently trying to make the 2 port too complicated. Could I also normilize the chart to 50 ohms instead of 500, or would that be more difficult to plot on the chart? By the way, sorry for not specifying the frequency- I was designing for 51.8 Mhz. One question, the entry "RES 1 2 R=50" I don't quite understand, I would think is should be R=500 since we are normalizing to 500??? What am I missing?

The R=50 is part of the "dummy" file, which is just a nonsense two-port file that enables you to access the Circles Utility. It has no meaning beyond that.

>radio grew to outsize ham radio by a factor of at least 10 in 1970).

HMMMm - pretty STRANGE that with all your keen analytical abilities, you NEVER connected the fact that the "easy to obtain" CB license just *might* have contributed to the far greater numbers - and poorer quality - of occupants on CB... OR, that ever lowering the "bar" to get into ham radio might deliver the SAME result... Dumbing down exams to increase our numbers MIGHT work, but at what cost?

"A thing easily obtained, is little valued"... Unfortunately, the very bands that are opened to those unwilling to "jump thru the hoops", in conventional style, will/have become the virtual communication pig-pens we are now "enjoying"... HELL, why not just GIVE the damn licenses away - look at the demand for equipment and lobbying power we would then have on our CB-style bands...

I have built a VHF receiver using the MC13135. I have reproduced the
circuit given in its datasheet. It is a dual conversion VHF receiver
using a very limited number of parts.
The circuit works fine, but the bipolar transistor based front-end is
not adequate to the rest of the circuit, high intermodulation and low
sensitivity.
Apart the low sensitivity, it seems to me to have an excessively high
intermodulation distortion. Despite the excellent selectivity, it is
completely dumbed by a 2W transmitter placed not closer than 30 meters,
even if it transmits 1-2 MHz from the receiving frequency. There must be

soething wrong. The data sheet did not indicate the supply voltage and I

used 5V. Maybe it is too low for the front-end?
Has anybody else faced and solved the problem, or can anyway help
suggesting a schematic for a simple but adequeate front-end?

Try going to your local Scout Group, or hotel/restaurant. Scouts tend to collect just about anything that can be recycled and you may find that a local restaurant has more bottles than they know what to do with. I have an arrangement with a bar near where I live (Melbourne Australia) and can get as many 750 ml dark brown bottles as I can fit in my car. Don't buy what you can get free!

To clean, get a plastic garbage can (clean) and pour in about a cup of chlorine bleach. Fill with cold water and then sink the bottles. Let them sit in that solution for about a week or so. Then dump out and rinse with hot tap water. The bleach sterilizes and removes stains and other yuck deposits. I them put my bottles in a 100 c oven for about half an hour, then let them cool with the oven door closed. I then charge and fill. Works great.

1088. Need to calibibrate my homebrew electonic keyer. How do you count WPM?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-26 00:00:00 UTC
From: java1@internet.cafe
Message-ID: <SAar2.4517$9P6.13191845@newsgate.direct.ca>
Source record: 74247

I built an iambic electronic keyer.

I wish to calibrate the speed pot on it.
Isn't there a formula like like count the number of dits
in 10 seconds and multiply by a factor or something?

Please reply via this NG.

many, many thanks
Bill

> evident.

I'm sorry. I didn't word this very effectively. I don't have anything against extra class, or people who really like Morse code. The above sentence was a little misleading, as you can't generalize "Code-Enthusiasts" as the problem. I should have said "Code-Enthusiasts who think everybody else has to be a code enthusiast or they have no business being a ham".

I think the key ideas here are that this is a hobby and morse code is just another communication method. For instance, if somebody has a Tech No-Code license and are active in repeaters and simplex, but they don't care for packet, you can't blame them for not wanting to jump head-over-heals into packet. Somebody e-mailed me saying, "As long as conversations are rewarding, educational or otherwise stimulating, what difference does it make ?" If some people find CW rewarding, that's great, but it might not be everybody's cup of tea... and that's okay, too.

Dan, you are right. Ham Radio is big enough for each of us to find the area of interest we want. However there will always be those who can't see it that way. The really sad part is they don't understand your point, never will and there is nothing the rest of us can do about it.

I'm shopping around for an O-scope for ham use. I've read on the newsgroups that some of the tektronics scopes from the '70's are good for hobbyists.

Now I have a line on a Kikusui COS6100M, which I hadn't heard of before, but it was supposedly built as a replacement for a Tek 465B. The price is fairly reasonable, but the seller doesn't have a manual. Anyone have experience with the Kikusui?

It's much easier to count the number of complete dashes in 5 seconds.
That gives you WPM directly (within 4%).

Been there; done that; got the QSL cards. Of course you have to be able
to copy in your head. With a keyer and paddle, CQ still sounds like
CQ--even over potholes. An automatic transmission helps.

Ever have to do something you didn't want to, to achieve an end result? Maybe it was as a child, or taking a class in college that had nothing to do with your degree. Maybe your line of work requires you to do something you don't like. It's a fact of life. We all have to do things we don't like. Too many people are dumbing us down because they don't want to hear the whining, and want to be politically correct. This has become a no-skills hobby. Just memorize some answers from a question pool and get a friendly VE examiner and you're in.

You need a video modulator. They might have these at Radio Schack. Or,
if you tinker, you can pull one out of an old VCR. You connect the
video signal from the camera to the modulator and it will give you a
picture on channel 3 or 4. Try an electronics part store. They might
have a generic sort in stock.

Others have already suggested sources for NEW bottles, here is what I
have done:
I typically keg most of my brews, but I always bottle some from every
brew for tasting and samples.
In Oregon we have a bottle LAW, so everything has a store deposit. I ask
the grocery if I can buy back some bottles, at the 5 cent deposit rate.
I then go in the back and pick out what I want, many have been sorted
for return to his suppliers so its pretty easy to get exactly what I
want.
When I get these home I fill the bathtub with soapy anti-bacterial water
as hot as I can get it...I fill the bottles and let then soak overnight.
Then I shake the water from each one and put then in the dishwasher on
POTS and PANS cycle using NO detergent.
5 cents a piece...my choice...all I need. It works great.

> > CAP 1 2 C=5PF
> > TEST1: 1POR 2 0
> > END
> >

The actual problem here was found to be in the TRL statement which should read:

TRL 0 1 0 0 Z=20 E=20 F=2.44GHZ A=0.8
instead of
TRL 0 1 0 0 Z=20 E=20 F=2.44 A=0.8

There was no "bug" in the Radio Designer Program or in the TRL element..

Pick up an old CB radio at a flea market or yard sale, convert it to 10m, lock it in Transmit, and key the VCC to the driver and PA stages (use some kind of small relay, as the current may be up to 2A or so on peaks). Power output will be in the 3 to 5 Watt range, but you should be able to de-tune it for less power.

1106. Cellphone to 902 MHz Ham ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-26 00:00:00 UTC
From: xhduff@ica.net
Message-ID: <36ae0c96.0@lightning.ica.net>
Source record: 74265

While there's a thread about cellphones on the go,
has anyone successfully converted a cellphone for
902 MHz Ham use ?

From where I sit, it looks like a pretty complex
undertaking since, for starters, the micro would have
to be reprogrammed and I would imagine that it is likely
a mask programmed ROM part...more than likely need to be replaced.
One would have to have the necessary programming tools
(cross-assembler and programming hardware).
Also, cellphones are full duplex...probably need some hardware
changes. Furthermore, a handheld unit would be a bugger to work on.

Any comments ?
Reply here on the NG or remove both 'x' from my address

Instead of re-inventing the wheel, I would
use a cheap CB ...

For oscillator stability, instead of keying the PTT line,
I would wire the TX oscillator to always be running
and key the buffer or driver stage with a PIC or other
simple micro.
Maybe consider beefing up the heatsinking
fot the PA. section too.
Some older PLL CBs could be programmed
to get into the 28.2 range...otherwise,
a crystal change could probably get you there
using a rockbound or PLL CB under ROM table
control.

Timing of Morse Code

The basic time interval is the dot-time.

Letters are made up from dots and dashes separated by gaps.
A dash is three dot-times long.

The gap between items in the same letter is one dot-time.
The gap between letters in the same word is three dot-times.
The gap between words is seven dot-times.

The following timings are based on the word P A R I S.

The morse code is .--. .- .-. .. ...

This contains: dot-times
10 dots 20
4 dashes 16
4 letter gaps 8 extra
1 word gap 6 extra

--
50

So, for example, 12wpm would require 12*50=600 dot-times/minute.
A dot-time would be 100mS.

wpm dot-time(mS) clock-rate(Hz)

12 100 10.00
16 75 13.33
20 60 16.67
24 50 20.00

The dot-time (in mS) is 1200/wpm.

The clock-rate is 5*wpm/6 Hz.

--

I can't remember where I found the above, but I hope it helps.

Harry (G6AUC).

One possible way of dealing with this would be to use the RF part and just ditch the control portion. The several cellphones I've dissected have all the RF circuitry on one board and the main CPU, display, and sometimes keypad on a second board, probably along with the audio stuff. There is a single multi-pin connector between these two boards.

If you could figure out what's wired to where on that connector, you could run all of the RF stuff from any other CPU.

However, there would still need to be a bunch of work done on the RF stuff to move it to 902+ MHz. Full-duplex operation depends on a duplexer, which seems to be made out of a bunch of tuned ceramic resonators coupled together, and with tuning of the individual resonators done by drilling or chipping little bits out of the ceramic. It's unlikely you could move these to a new frequency. At least one of the cellphones has a similar two-resonator filter between the VCO and the RF power module - that would have to be replaced or removed.

On the other hand, the frequency-determining parts (PLL and VCO) might well work at the slightly higher frequency, and the IF would likely be usable unchanged. (Though you might want to use narrower filters - AMPS is 12 kHz deviation for good sound quality, while amateur practice seems to be to use 5 kHz).

Dave

1111. R1842/WSC-5(V)-- conversion info?

Hello--

Does anyone know of a source of specs (e.g., frequency coverage)--
and especially the connector pinouts? Has anyone ever put these boxes
to use other than as parts sources?

Tnx es 73,
Brad AA1IP

>the manufacturer too much if they are being put in these. Does that mean
>they aren't particularly good? Because cellphones doe seem to be a cheap
>source of TCXO's

They're probably not the most expensive TCX0's in the world, but if you look at cellphone specs they're generally rated at something like 3 PPM frequency accuracy (1 PPM for NAMPS). Amateur gear, using uncompensated crystals, is usually specified for 5 or 10 PPM. So cellphones do have better oscillators.

>Both of the cellphones I took apart had 15.36MHz TCXOs. One could use it
>in a frequency counter as long as you included the divier chain.

One of mine was 15.36. That's a bit of a pain to use. Most frequency counters are set up for a 10 MHz timebase, and to get that from 15.36 you need to divide by 192 and multiply by 125. That can be done by some counters and a PLL but it's not trivial. The other one is 12.0 MHz, where you'd need only divide by 6 and multiply by 5 - but it still needs a PLL.

This applies to off-the-shelf frequency counters. If you were building one from scratch including writing the code for the CPU, you could use just about any timebase frequency and get the display correct.

Some GPS receivers are also a good source of TCXOs. Sometimes they are a weird frequency like 16.368 MHz (16 times the 1.023 MHz chip clock), but I've also seen 10.0 and 25.0 MHz.

1117. Building a Compact TNC

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-27 00:00:00 UTC
From: Daniel Zimmerman <zimmerds@clarkson.edu>
Message-ID: <36AFC8B4.12C8AC6F@clarkson.edu>
Source record: 74076

I've recently acquired an HP48G calculator which I have found would make an ideal terminal for operating portable packet with a handheld. The problem I have is that the only TNC that I have is a Kantronics Kam+, which is a bit large and a bit too power-hungry for portable use. I will probably end up purchasing a small battery powered TNC, but I was wondering if anyone could point me in the right direction for constructing a small homebrew one. The catch is, since I am using a calculator as the terminal, which has 32K max of storage+operating memory, I need a true TNC. I can't use any type of software encoding/decoding. I need it to decode/encode everything, and send the data via RS232. If anyone can help, I'd be interested.
Thanks.

I just finished reading all of the "anti-cw" bla bla bla. Wow, what a mixed bag.
But the truth is, morse code is the root of all forms of electronic communication devices. I've been a cw only operator for 30 years, and don't begrudge anyone
that wants to talk with their mouth or a modem. But those of you who don't use a key are really missing a unique form of expression. Copying one another's code can be like listening to and creating music.
(especially up around 30 wpm).

For a one-port network ARD gives the input impedance using MZ11, PZ11, RZ11 and IZ11. To get input admittance use MY11, PY11, RY11 and IY11.

1121. VX-5R accesories big help needed! =)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-27 00:00:00 UTC
From: firewave@REMOVE.videotron.ca
Message-ID: <firewave-2701992344040001@192.168.1.4>
Source record: 74080
Cross-posted to: rec.radio.amateur,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Hi,

i m in the process of looking at a place to buy my VX-5R (i live in montreal (sorry for my english) if you have an idea of how i can order it without paying the local tax or if its from the US how not to pay the canadian tax (if any) when entering the country (custums taxes?) or any other suggestion for the cheapest price with the best things :))

I have questions about accesories mostly, because all i have is there name and i d like to get feedback from people who have them or who have pictures of them etc any information is useful! :-)

First of all, what is the VX-5R comming with? i heard it was charger/ battery/ antenna/ clip...Is that all? the charger is the radio right? or is it an external one? and does it comes with a DC cable?

Accesories:

What are the NC-72B(18$US?) (Charger for Lithium-Ion battery & Rx AC adapter) and CD-15(29$US?) (Rapid charger for use with NC-72B charger) for? Or more exactly how do they fit together? are they really useful together? and the NC-72B alone? How long for a full charge? (considering i heard the radio was taking 4.5hours) and what is the E-DC-6(7$US) (DC power cable; plug, wire and fuses only) cable for? doesnt that comes with the radio?

E-DC-5B(26$US) (DC cable with voltage regulator and cigarette lighter plug) is a good choice?

FNB-58LI(69$US) (Lithium-Ion battery 7.2v @1100mah) is there a better battery than that? is buying a second battery that useful (Read: will the first one die within a year or 2?) and if i buy a 2nd one is the above charger + quick charger add on needed?

FBA-23(25$US) (Case for 2 AA alkaline battery) What is the Tx power when i transmit with this? is there a better AA case? 4 or 6 batterys?

CN-3(8$US) (SMA to BNC adapter) self explanatory but im including it anyway for others who are looking for accesories :)

CT-44(12$US) (Converts to 2 pin microphone connections) Ok, what is this? is it only a one hole plug like the small sound plug used on Soundblaster/radio etc? or else, are there any earphone/mic like the MH-34B4B(30$US) (Compact speaker microphone) or the MH-37A4B(30$US) (Compact lapel mic with earphone) that also have a normal sound plug(so i can plug the radio into my soundblaster)? How do these or other

earphone/mic performs? any suggestion for a small earphone/mic on the shirt with a normal sound plug that works with a VX-5R ?

SU-1(35$US) (Barometric pressure sensor for pressure and altitude) Is that really accurate(how accurate in pressure and in altitude?)? is it worth it? does it use a lot more batterys? Is it conflicting with radio hardware or software modification? how does it plug to the radio?

CSC-73($19US)(Case for the VX-5 radio) is that case worth that much money? shoudnt i just make my own? :)

VC-25(62$US) (Lightweight VOX headset) what is this exactly? the same as the earphone/mic but for home use? (big headset?)

Computer DB9 cable...here i have a bigger problem...i dont want the cloning software i ll just enter things by hand but i d like to be able to modify the radio with the software mods...is there a place where i can only buy the cable at a much more reasonable price? (http://www.icongrp.com/~sllewd/pcware.htm this is a shematic i found i think its the same for the VX-1 VX-5 IC-Q7 and more)

Users: what are your impressions? how much can you transmit before the battery dies? etc? :-)

THANKS A LOT in advance for all the answers, it ll probably help other choose their accessories =)

Alexandre

Unless you are timing your bug, which doesn't make dashes automatically!
:-)

I got into that a while back when I was checking to see just how slow this or that bug would run, and I arrived at the same dot figures that have already been posted.

I was watching the bug's output through an ohms probe on a storage oscilloscope, catching one-shot displays. My reference was the period of one dot/space combination [120 ms = 20 wpm], and in the process, I found out an interesting thing: the bugs that I tested did *not* slow down as the pendulum travel was increased from what I consider to be fairly short travel all the way out to really long travel. As a matter of fact, the speed actually increased by a [probably] negligible but repeatably measurable amount as the travel was drastically increased.

I've always heard that the opposite was true....

Thanks for the info on the dashes though, Ian! That would be quite handy on a keyer.

1123. [Q] FSK bandwidth for 10-megabit Ethernet

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-27 00:00:00 UTC
From: John Miles <jmiles@pop.removethistomailme.net>
Message-ID: <36AFFCA9.425E@pop.removethistomailme.net>
Source record: 74082
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design,rec.radio.amateur.digital.misc

I'm wondering if anyone can answer a couple of basic questions, and/or point me towards some good, easy-to-understand references on FSK communications theory. I've done the DejaNews thing, looked at a few dozen web pages, and pored over various editions of the ARRL handbook, but haven't yet found the answer(s) I'm looking for. Thought I'd throw the issues out for general discussion.

Here's the problem: I'm interested in determining a reasonable channel bandwidth for an RF modem capable of handling 10-megabit Manchester-encoded Ethernet data from a 10BaseT interface. The modem will use simple FSK modulation, probably with the MC13155 chip, and I need to determine some good working values for the peak FM deviation and IF bandwidth requirements.

It's my understanding that support for 10-megabit Ethernet dictates that signals up to 20 MHz be passed without substantial phase distortion. Looking at an actual data stream on a storage scope, it appears that every Ethernet packet is preceded by a dozen or so cycles of a 20 MHz burst, presumably for clock synchronization, so I'm assuming that the system 3-dB bandwidth needs to be at 25 MHz or so. Unless I'm off base, 25 MHz seems like a good starting point.

A good estimation of the RF/IF bandwidth required for an FM channel is given by Carson's rule, i.e.,

bw = 2 * (highest modulating frequency + peak FM deviation)

This works out reasonably well for conventional FM audio transmission applications with modulation indices of somewhere around 1 or more. An 18 kHz FM channel can carry a 4 kHz signal with a deviation of 6 kHz (modulation index = 6/4 = 1.5), and so forth.

Now, for conventional FM voice communications, typical NBFM modulation indexes seem to be in the 1 to 2 range. What I am wondering, is what modulation index values are generally chosen for FSK data transmission, and on what basis? Plugging in a modulation index of 1.5 for my 25 MHz channel yields a total bandwidth requirement of

2 * (25 MHz + 37.5 MHz deviation) = 125 MHz

125 MHz for 10-megabit FSK seems awfully high to me, in light of existing designs that seem to get away with much less bandwidth. Glenn Elmore's page at http://www.tapr.org/~n6gn/uwavelink/faster.html suggests that it's reasonable to use a peak deviation of 2 MHz with 10 Mbps data, yielding a channel bandwidth of only 14 MHz, but I have two questions about his derivation:

1) Glenn's application of Carson's rule, 2*(2+5)=14, assumes that a low-pass cutoff of 5 MHz is sufficient to transmit 10 Mbps Ethernet data. I don't see how this could be the case, given the presence of much higher-frequency components (like my observed 20 MHz burst) in a real-world 10BaseT signal.

2) A peak deviation of 2 MHz with even a 5 MHz maximum frequency works out to an FM modulation index of only 0.4. With a 25 MHz cutoff the modulation index would become 0.08. These figures are much lower than the the modulation indices used on FM voice channels, suggesting that perhaps I'm mistaken in applying terms like "modulation index" to FSK in the first place. Are these modulation index values reasonable for FSK data transmission, and if not, what should I be shooting for instead?

Obviously these are some pretty fundamental questions, and I don't mind replies like "you don't even have the basics right, you need to hit the books," as long as they are accompanied by pointers to good references on the subject. I know Glenn Elmore hangs out here, but I have already bugged him enough in email on this project, and have concluded that what he is calling "10 MBps Ethernet" on his web site is somehow very different from what I am seeing with an actual 10BaseT link. :) He reports success in running a MC13055 demodulator at 10 megabits with the above FM parameters, but I have been completely unable to duplicate this feat on my own bench. No doubt I'll get good empirical results by tinkering around with the faster MC13155 chip, but this is one of those cases where I would rather have a sound theoretical knowledge of what's going on.

TIA for any insights!

Another source for these is to visit your local thrift store and find an old original Nintendo system. Inside is a 12v powered modulator for ch 3 and 4.

I bought several of these at the local thrift for $3 apiece.

Same deal here with my IC745 and D104. My cure was a 60 foot wire attached to my antenna tuner ground lug: an extra COUNTERPOISE in effect.

That electret condenser mic preference of ICOM has caused a lot of people a lot of trouble. For one thing, you can't easily experiment with microphones. It's either the SM6, 8 or 20, and that's it. I've heard the HEIL preamp works, but is kind of pricey.

Good luck - 73, Joe , W1GFH

Source record: 74189

-- Charles,

As much as I would like to follow in your thoughts, I stray with common
sense.
The responses I receive are apparent in negative content.
CushCraft is now the AMF of Harley motorcycles.

If CushCraft had personal pride in their products they would support
there functionality with spare parts.
The lack of personal drive that keeps a person from doing the best they can
baffles me.
Money never makes up for loss in personal pride.
As a cart in front of the horse, Money will not buy the personal pride of
a job well done.
The argument is with CushCrafts lack in talent customer
relations and availability of parts.
This is the focus I wish to make others aware of.

On the topic of antennas!
My limited understanding in design of collinear arrangements providing
10dbd gain on both VHF and UHF while mounted in a radome with .7 windload
forces me to offer my dependence on others.
My understanding of Smith charts, Grid dip meters, antenna analyzers,
and System analyzers is fair enough to understand my limitations in
manufacturing a ARX270.
There is no perfect Antenna or anything in this world.
I express myself as paying nearly $300 for a good design damaged by a
storm.
Again I do not fault in the design and antenna itself.
I just need a few SMALL replacement parts.
What I need are a few capacitors, and a few Cushcraft employees to get
off their $##$% and walk over to a parts bin and gather what I need.

Your Harley may be the perfect design for you.
A BMW motorcycle meets my needs.

Next time you need a new oil seal on your Harley maybe they will tell you
you must purchase a whole New evolution engine to fix the problem.
Hey nothing is perfect!
The history of Harley/ AMF and how the pride effected the quality and
support is something we can reflect on.
Hey! 0000000, If thats a Honda in the picture then The AMF stuff
didn't make sense did it?

YA! YA! I wear a Helmet and have been for 25 years.
My choice, after I witnessed the effects of cyclist cranium plunge into a

windshield, caused by less than perfect attention span.
I have tested the Cause and effects of helmets as I raced Enduros
in younger days.
Maybe Effects are still evident!

Ps.
I have made so many Ham antennas over the years, AU and CU trace elements
are making my hair silver.
I will be in working in Richardson mid March
Take care of your pride,

Jack Kovar

Lyle Koehler wrote:
>
>E.g.: A properly adjusted electronic key gives a string of dots that
>counts to 10 dots per second. Speed = (60 X 10)/25 = 24 w.p.m."
>
That's true, but who can count 10 dots at that speed while also
accurately timing 1 second?

Counting dashes for 5 seconds lets you count at half the speed, and it
also makes the interval timing much more accurate. It also eliminates
the arithmetic.

Proof:
Count 24 dashes in 5 seconds.
A dash is (three bits mark + 1 bit space, so that's (24 x 4)/5
bits/second.
Using the conversion above, that 10 dots/second = 24WPM, it means that
20 bits/second = 24WPM.
So our count of (24 x 4)/5 bits/second = (24 x 4)/5 x (24/20) WPM
= 23.04 WPM

So, you're out by a whole 4%! If you make it a rule to count the last
dash if it *started* before the 5 seconds ran out, the chances are
you'll count exactly the right answer (to the nearest whole number) at
normal communication speeds.

But that is probably analysing it too much. The simple bottom line is:

WPM = number of dashes in 5 seconds... close enough for ham radio.

Erm, this may be a silly question, but WHY do you want to calibrate it?

Surely you just USE it, setting the speed to a comfortable rate and/or
to match the other guy.

The IC-2000H is very similar to most other VHF/UHF FM radios, that it
is a single-loop, single VCO PLL design that has a moderately long
PLL lock-up time (I believe greater than 100mS). During this
lock-up time, the transmitter bounces onto frequency. It doesn't
sound pretty and the speed with you can send is quite limited.
Before you try operating Morse with the radio by keying the
PTT line, try listening to the signal. You can get a much better
transmitted signal by keying the driver stages in the transmitter,
holding PTT down the entire time, but this might not be trivial.

What are you going to do for a receiver? The FM receiver won't
make much sense, but it occurs to me maybe you could use the
AM receiver mode with the addition of a 455KHz BFO. You've
got to build this carefully if it is to be even remotely reliable
in a mobile.

> I haven't even looked at the schematic yet but was thinking about a varicap
> diode tapped into the LO and using a pot to swing it up and down. Can
> someone give me a sanity check on this? Am I headed in the right direction
> or is there a better way?

Not for transmit, maybe for receive, but I think you're better off
with a tunable BFO. It won't work for transmit because there's no
LO to adjust, the loop synthesizes on-frequency.

You are a pathetic fatuous Internet Fashion Victim. A braindead
exclusivist brother to the (now thankfully out of date) yuppie
who deliberatly irritates everyone around him by loudly conversing
on his cell phone. An insecure wretch who's actions are demands
for attention though the display of his adult toys. You're just
saying "LOOK AT ME, I OWN THIS NEAT TOY!!!!!".

>I 'd suggest changing your way of accessing Usenet to one
>which conforms with modern standards. Believe me, the ability to
>dereference a URL at will is worth the $20 a month it costs (in the US,
>at least).

Why does everyone think I'm objecting to this because they think I
lack the access? I'm objecting to it because, after being 'here'
for a dozen years and begin proponent for one of these newsgroups,
(and sticking my oar in during the creation of the other), I have a
philosophy of inclusivity when it comes to access to the newsgroups.
(In other words, I think about how postings are used and the value they
have to the entire user population).

Tieing things together that don't need to be is considered a bad idea.
(Too bad the authors of browser software are incapable of absorbing

that concept).

Remember:
Newsgroups can be gatewayed to mailing lists. Users of these Email systems may be limited by their software or simply not have access if someone else provides their connection, as in the case of an employee who can only use what they are given or have to operate through a restricted firewall.

News is just data. Even people accessing through a BBS in East Possum Trot have a right to participate.

News hangs around. Some day Amazon isn't going to be around. Or you may want to print out a message thread for someone who has better things to do with their time.

News is just data. My offline news reading system lets me read news faster than the autorepeat in my keyboard. Probably 20 times the rate of someone online through a serial port to an nntp server. I have kill files that can do ANYTHING. All on a Linux system that's worth so little some people wouldn't dig it out of a dumpster. (Next stage is to get a laptop and get a newsreading system portable enough to use in the bathroom, or on a bus, a parkbench, ...). Don't project your methods of access to everyone else.

>Besides, in my understanding at least, ISBN numbers are not going away
>anytime soon. Even if you can't follow the URL itself, or if you are a

Look, all I need to do is look at my bookshelf and read them off the barcodes on the back. You could have typed "Hayward's Intro to RF..." in less time that it took to play with your mouse to extract that URL.

Beleive me, they are not loosing money!

On things like this, they are counting on most people going over the $60 worth of airtime per month.

I used to work for a major US cellular company. I know how ruthless they can be. How do you think they pay for all those employee golf outings?

Does it depend on whether your NRO is open-circuit or short-circuit
stable? O/c stable looks like a parallel-tuned circuit of infinite Q,
and s/c stable looks like a series circuit, IIRC.

Some modern TVs have a direct video input, intended to hook to a VCR. This gives better picture quality than the RF interface.

Of course, the camera must operate in the correct NTSB format. I would not make that assumption without verification. This must also be true for the RF modulator.

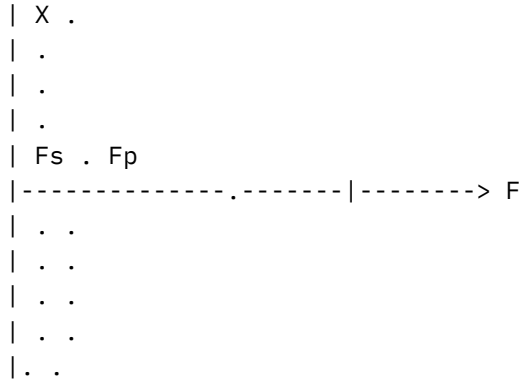
Previously Bert Douglas asked
"should the phase slope be positive or negative wrt frequency?"

At the risk of attracting some flames, here's my (27 year old) recollection on this.

Fosters reactance theorem states (some thing like) "the derivative of the reactance with respect to frequency is always positive". ie. if the impedance is represented as R + jX, then as the frequency is raised the value of X becomes more positive / less negative. At parallel resonant frequencies (infinite impedance), this becomes a little obscure as the sign of X suddenly switches from + to -, but the slope is always positive.

Maybe a graph typical of a crystal near its fundamental frequency may help illustrate.



Regards, Phil Rice VK3BHR

Thanks for the answer, but no crystal is involved. Just a transistor, and a capacitor, and some lengths of microstrip. I am asking about the phase slope of S11, not impedance. ARRL radio designer does not show impedance(it lies). I can convert to impedance manually for a few points, but it is difficult to get a clear picture (and tedious). I can arrange things so the phase slope of S11 goes either up or down. I presume that one way is better. Or does it matter at all?

Thanks,
Bert Douglas

> suggesting a schematic for a simple but adequeate front-end?

I don't think the front end is saturating, I think it's more likely the
MC13135 is saturating. This is a very low power device drawing 3.5 ma
that seems to be intended for toy walkie talkies. The spec sheet says
the input 3rd order intercept point of the 1st mixer stage is -17 dBm
referred to the input. That's not too good for a communication receiver.

If you put a preamp in front of it, then the IP3 referred to the preamp
input is probably below -30 dBm. (It's lowered by whatever the preamp
gain is.)

Also the 2nd mixer has an even worse input IP3 of -27 dBm or -40 dBm with
the preamp! Anything that gets thru the 1st IF filter will really overload
the receiver!

I think the bottom line is you should choose higher level mixers for
your receiver if you want to operate around even a 2 Watt transmitter.

>and s/c stable looks like a series circuit, IIRC.

It is open circuit stable. Reactance of the transistor is inductive.
Transistor is common base. From emitter there is some transmission line,
then a capacitor, then 50 ohm resistor, then ground.

Well, the official standard in the U.S. is the word PARIS sent repeatedly. For 5 w.p.m. for example if the word "PARIS" could be sent exactly five times properly spaced in one minute, the keyer would be set to 5 wpm. However please note that it's probably easier to learn the code in the long term with the wpm set to some speed like 13 wpm (Commonly Called Farnsworth Method) and spaced so that the words are set for 5 wpm. Please note however that I would urge that people learn the characters at some speed like 22 wpm, with the proper spacing to avoid some of the difficulties associated with the old method of learning code again and again. I have yet to meet anyone who can copy let's say code at 5 wpm with the characters sent at 20 wpm who can't copy code sent at 5 wpm exactly for an exam.

These displays (MZ11, etc) don't seem to have correct information. When I convert manually with my calculator they don't match S11. For starters the magnitude of S11 is greater than one, this should correspond to a value of RZ11 that is less than zero, but it is not.

But I received advice that I have to place manual termination to get results that correlate with S11. I will check this out.

There are three things:

1) When setting up the one-port, it should include the circuit's "output" termination "inside" the one-port.

2) If the input resistance is negative, put a resistor across the input so that the net resistance is positive. Then calculate the value of the negative resistance that is in parallel with the positive resistance.

3) Plot MZ11 etc on a rectangular plot rather than a polar plot.

Hi John,
I did a similar thing to this almost a decade ago.
My task was to extend our company's computer network about 200 metres (to a new building we had just leased in the next street).
I was given a low power FM video link in the 10.5GHz band. The baseband bandwidth was quoted as 7MHz, but it was only about 1 dB down at 10MHz when I measured it on a network analyser. The link was designed to operate in a 14MHz RF bandwidth. I don't remember what the deviation was set to.
(The link was one of our products, so we had spare ones lying around.)

We used arcnet instead of ethernet (I said this was a long time ago!). Arcnet uses token passing, and runs at 2.5Mbps with 3 level signalling, IIRC. I think it looks a little like filtered AMI. The voltages are huge! Something like 10Vp-p.
I modified an arcnet repeater box, and brought out Tx and Rx streams on separate coax connectors.
[You are using 10baseT, so you already have separate Tx and Rx signals.]
The Tx signal went into a pad to adjust the level and match the 93ohm arcnet and the 75 ohm video input of the link.
The Rx signal from the link went into a high speed opamp for some gain, and then a hybrid buffer amp (LH0002 ?) to drive the arcnet.

Suprisingly, it worked first time. I just had to tweak the gain to get it to work reliably. It only took a few days from being given the task to having a working bench model. It went on-line a few days after that.

The RF output had several spurs many tens of MHz away from the carrier. These were way outside the spectral mask for the channel. Sorry, it was so long ago, I can't remember just how bad it was. However, the power was so low (we used high gain dishes, I think the Tx power was << 0dBm), that the output spectrum was not relevant, as the whole thing was in the "unlicensed" category. YMMV, depending on the communications authority in your country.

I guess I could have tried to filter the Tx baseband signal, but then I would have needed to perform the complementary filter operation in the receiver.
Another way would have been to use comparators to slice the receive signal at some (possibly adaptive) threshold. The outputs of the comparators could be combined in some way to produce a better looking pulse shape.

IIRC, 10baseT uses two level signalling, so you would only need one comparator.

Another thing to look out for is the DC resistance of pulse transformers in network interfaces. My receiver output had a small amount of mains hum which caused a large current to flow at 50Hz. The prototype blew up after a week. I fixed it with a series capacitor.

So much for the cheap and dirty solution. The better way to get ethernet across a radio link is to do the following:
1. Get a pair of ethernet routers or bridges with wan ports. Routers that do address filtering are better, as they reduce the traffic on the wan link.
2. Use a digital radio to connect the wan ports.

I contend that this way is better, because it will be easier to monitor and control, and it won't trash the network at either end when the link gets noisy. Also, each ethernet will be in a separate collision domain, which helps when they are heavily loaded.
Most networks will already have a router, bridge or switch installed somewhere anyway, so there will be no major additional costs.
It is also possible to turn a PC with a high speed serial card into a low cost bridge.

If you want to roll your own bridge, you can do it quite cheaply and with no software. See:
http://www.rad.com/components/componnt/rj017.htm
for an (almost) single chip bridge. Its wan port can be set to any speed up to 40Mbps.

I suggest that 2Mbps is probably enough for most ethernet applications, and 2Mbps digital radios are quite cheap. (We also made these, so they were just lying around...)
You could also get a radio which uses a more bandwidth efficient modulation, such as trellis coded QAM.
For example, 64QAM (not trellis coded) could be used to transmit 10Mbps in only a little over 2MHz of RF bandwidth.

Good luck,
Allan.
(I don't work for that company anymore.)

The Radio Designer program is quite capable of dealing with negative resistance,
according to my testing of it. It is probably best to use the rectangular plot
rather than polar plot.

Get a keyer chip from K1EL. He will sell you a 8 pin PIC CPU with your call sign preprogrammed in for $6!!! It is a powerful and elegant chip with preprogrammed messages and many other functions! Check his web site at http://members.aol.com/k1el/k8info.html for detail.

My suggestion is to convert a SSB CB radio to 10m. Cheap to acquire, easy
to convert, good receiver, lots of fun to use.

CW is a MODE. Nothing more, nothing less. And as such CW should not be given any special consideration over any other mode.

You talk about "Dumbing down" the ham tests. I couldn't agree more. But why is it only a travesty when we talk about reducing (or eliminating) the CW requirement? Why do the vocal nay-sayers have nothing to say about the fact that the "theory" tests have become nothing more than a formality. People memorize the questions and answers, pass an easy multiple guess test, and presto!, they're hams. I guess it's ok as long as they sweat and learn CW.

I would much prefer the elimination of CW as a requirement, and at the same time, go back to comprehensive theory testing. No more multiple choice. Put those formulas to work, draw a colpitts oscillator schematic, design a simple 2 transistor QRP transmitter from memory. That way, we can be fairly certain that the new "hams" will have a better knowlege of radio, not just one mode of it.....

1197. Current limit resistor for LED (basic question)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-28 00:00:00 UTC
From: bogus@supernews.com
Message-ID: <bogus-2801991359380001@dnai-216-15-121-45.dialup.dnai.com>
Source record: 74116
Cross-posted to:
sci.electronics.repair,sci.electronics.basics,sci.electronics.design,sci.electronics.misc,rec.radio.amateur.homebrew

I'm trying to get the maximum brightness from an LED that has these specs:
10-20 mA @3v.

I've tried a 650-ohm series resistor which gives me these measurements,
using a 12.5 volt supply:
16 mA, 1.8 v drop across the LED.

If I'm not mistaken, the actually current and voltage aren't important,
but the total power dissipated by the LED is. I calculate the maximum for
this LED as 60 mW (20 mA x 3 volts). With the 650-ohm resistor, I
calculate only 28 mW is being dissipated by the LED, which leaves lots of
room for improvement.

My confusion comes when I try to calculate what resistor would be best in
this circuit. If the LED draws current determined by the value of the
resistor, and the voltage at the LED depends on the voltage drop across
the resistor, how can one calculate the correct resistor without actually
trying some values and taking measurements?

Am I trying to think of the LED as a linear device (current and voltage
are linearly related), when in reality it is not?

Any help understanding not only a good resistor value for this LED, but
how to properly think about the application of ohm's law in this
circimstance, would be greatly appreciated.

Sorry for the modified return address, but I hate getting spammed. Correct
address is shown below.

Thanks,
Dave

<snip clear and detailed expression of problem>

>Am I trying to think of the LED as a linear device (current and voltage
>are linearly related), when in reality it is not?

Precisely so. With a supply as high as 12.5V you will get a very good

approximation by assuming that the LED's forward voltage drop is fixed
at around 1.8V, more or less independent of the current through it
(it might be anywhere between 1.4V and 2.0V depending on the type of
LED and other things, but that won't affect the calculation by more
than a few percent as you will see).

So with a 12.5V supply and 1.8V lost across the LED you have 10.7V
left to drive current through the resistor. 10.7V at 20mA sounds
a lot like 535 ohms to me - err on the high side so you don't risk
exceeding the LED's maximum current, and go for 560 ohm.

If the LED forward voltage was as high as 2.2V (very unlikely - I
don't know where the 3V figure came from, it's bogus) then your
circuit would put only 10.3V across the resistor and the current
would be a tad lower. No big deal though.

I don't think it is very helpful to ask about the power dissipation
in the LED. Unlike filament lamps, LEDs don't rely on the heating
effect of the dissipated electrical power. Go for the LED's rated
current, and ignore the voltage specs except as a guide to calculating
resistor values as above.

Note that the calculation I've given is only slightly affected by
changes in the LED forward voltage, because your chosen supply
voltage (12.5V) is so much higher than the LED's voltage drop. But
if you try to do the same thing with, let's say, a 3.6V supply
(one lithium cell) then the calculation becomes unpleasantly
sensitive to changes in the LED forward voltage drop, and it
can be a good idea to do something a bit cleverer with
a constant-current source to drive it.

While you're at it, look up any good electronics primer such
as Horowitz and Hill, and find out about load lines - they

will help to answer your question.

DaveC wrote:
>
> I'm trying to get the maximum brightness from an LED that has these specs:
> 10-20 mA @3v.

Unfortunately, those are incredibly vague specs. Is this your garden-variety red LED? If so, the forward voltage drop at 20 mA is more like 1.8 to 2.0V.

> I've tried a 650-ohm series resistor which gives me these measurements,
> using a 12.5 volt supply:
> 16 mA, 1.8 v drop across the LED.

That's pretty close to the 20mA rated current. Most garden-variety red/green/yellow LED's will be rated for a 20 or 25 or 30 mA max continuous current. If you pulse the LED's, things get more complicated, but 20 mA average with maximum pulse of 50 or 100 mA is typical.

> My confusion comes when I try to calculate what resistor would be best in
> this circuit. If the LED draws current determined by the value of the
> resistor, and the voltage at the LED depends on the voltage drop across
> the resistor, how can one calculate the correct resistor without actually
> trying some values and taking measurements?

You can't, really. Most LED manufacturers publish a forward current vs forward voltage curve that would take place of such measurements. But it sounds to me like you might not even know who manufactures your LED.

> Am I trying to think of the LED as a linear device (current and voltage
> are linearly related), when in reality it is not?

Current and voltage are defintely not linearly related for an LED. A better model is that of a diode.

> Any help understanding not only a good resistor value for this LED, but
> how to properly think about the application of ohm's law in this
> circimstance, would be greatly appreciated.

A better model is a diode, with a forward voltage drop of 1.8 or 2.0 V. If the power supply that's powering the LED will have a large variation in voltage (i.e. a battery, or a non-regulated supply) and you're concerned about getting a constant current, then I'd seriously look at a constant-current regulator (take

a look at the LM317T data sheet for a very simple example.)

If maximum brightness from the LED under varying conditions is important to you, you'll really need the specs and curves for the LED you're using. In addition to this, a good application note to read is HP's series on their super flux LED's - particularly Application Note 1149-4, "Thermal Management Considerations for Super Flux LED's".

Anyone have an opinion on the simple 2 knob antenna tuners offered by MJF? Want a low power tuner for random wire and "L" antennas.(200 watt capability more than sufficient) Can't seem to find much in the way of consistent data for building one on the bench.

Would actually prefer to make one but have not found values (inductance steps, # of turns of a given wire on a given coil form size, etc) anywhere for a tapped or variable inductor.

Any assistance would be greatly appreciated.

The LED will drop a pretty constant voltage irrespective of current passed (within limits). So assume a volt drop (1.8v) and then decide what current you want to give a resistor value. If you want to get lots more oomph out of the LED you can pulse it with up to an amp or so, but the pulse of current needs to be very short - microseconds/milliseconds - so a timer/oscillator is needed.
hope it helps

Check out the latest issue of QST. You can by a complete set of CD-ROM's
that contain every issue of QST ever published from 1915 through 1994 for
less than $400; there's a big price break (about $66) if you order them
all at once.

And that four-year set (recent years) includes four (not one) disks.

I use the MFJ 16010 antenna tuner which is the one you are referring to (I think) and use it to match my coax feedline from my long wire to my receivers. It seems to work fairly well although the tuning doesn't seem to be very fussy and I usually don't have to retune at all unless I get up beyond about 12 Mhz.

Sounds like you got lucky with the 10base2 transceiver, getting it to work the first time you powered it up! I am seldom so lucky... it'll be interesting to play with the MC13155 chip this weekend and see if my luck changes versus what I was getting with the slower 13055.

I am just planning to run this link across a ~150-foot parking lot with a couple of K-band Gunnplexers, so I am not horribly concerned about total occupied bandwidth as long as it turns out to be within the 13155's limits. I am, however, concerned with the fact that I don't know, and can't seem to find in any textbooks, the theory behind how much frequency deviation should be used for FSK and what the tradeoffs are.

I agree that the "better" way is to get a couple of actual Ethernet bridges and connect them with a commercial radio link, but considering that all I am trying to do is learn a little about high-speed data transmission and play a decent game of Quake, I don't think I can justify the $6K-$15K budget that the commercial solutions demand. This is strictly for personal amusement and telecommuting rather than any type of mission-critical commercial application.

There is a severe shortage of good literature in the ham community on 10-megabit data transmission theory and practice. There are plenty of DejaNews entries with people asking "how do I make the N6GN design work at 10 megabits," but to date nobody has reported details of a successful, reproducable project. If all goes well with the MC13155, it might be nice to put a short article in QST or QEX detailing the design

of the RF modem and its 10BaseT interface, just for the benefit of posterity. That is one reason I am not comfortable just fiddling with the deviation and channel bandwidth until it happens to work -- it is hard to look scientifically-enlightened when you can't fill at least a couple paragraphs with complicated-looking equations. :-)

Well, I'm going to try and get one of you wizards interested. I have a hallicrafters S-120. Voltages to the tubes are ok. I can hear slight noise through headphones when fired up. Is it not tuned? Tubes have all been replaced. Would there be a difference if I changed the IF transformers? Trying to restore it, in the mean time, I guess the new ten tec is working fine. Just wanted new IF cans can't seem to find any that size. Put some smaller 455khz cans in, doesn't seem to help, even when I tune them. Any ideas? Thanks. 73 de KD5FES.

Mark,

I've been using a second-hand tuner, a small 3-knob, 200 watt
MFJ-901B, connected to my Yaesu FT-1000 MP. It's about as small as
I've seen. I took the cover off and squeezed the connector rivets to
ensure a good ground. I turned off the the rig's built-in automatic
tuner and connected the external tuner, and found it does a good job
while running 100 watts. It's small, compact and has a balun inside.
I'm going back to the auto tuner and will save the external tuner for
homebrew projects. No problems - I'd buy it again.

>16 mA, 1.8 v drop across the LED.

Which is below the maximum voltage drop of 3 volts and below the 20 mA
maximum and 16 mA is in the center of the range of (10-20 mA). R =
(12.5-3)/15mA = 633 ohms. Pick the closest standard resistor (e.g 620
ohms) and err on the high side.

Use a current source or sink.

>
>Am I trying to think of the LED as a linear device (current and voltage
>are linearly related), when in reality it is not?
>
I hope not. It's a Light Emitting Diode. I don't see resistor here.
Diodes have forward voltage drops. I = Io * e (qV/Akt-1) for an ideal
diode. Io a constant, q=charge on electron, V = voltage, k = boltsman's
constant, t =absolute temperature.

>Any help understanding not only a good resistor value for this LED, but
>how to properly think about the application of ohm's law in this
>circimstance, would be greatly appreciated.

The product of the voltage across the LED and the current through is it
the heat dissapated by the LED that is not converted to optical power.

Perceived brigtness is also dependent on the eye's sensitivity and it's
different for RED, GREEN, BLUE and AMBER light.

Think about this. From the standpoint of the external circuit, the product of voltage across a load and the current through the load is the rate at which electrical energy is being dumped into the load and is equal to the rate at which electrical energy is being extracted from the rest of the circuit (due to that load). So, if what you say is true then ALL of the electrical energy that is dumped into an LED appears as heat leaving none for the photons that make up the optical output - therefore there can be no optical output unless one of three things is true: (1) photons have no energy, (2) an LED is a free-energy device or (3) An LED has some other energy input.

Since I don't buy any of these three, I am forced to conclude that your statement is flawed and that the product of the voltage across the LED and the current through it is equal to the sum of the rate at which heat is being generated in it AND the optical output power.

This is the way we used to do it in the old days with multiplexed LED
digit displays.
You can probably do better with duty cycle much lower than 50%.
Once you've decided to go for the switching overhead, you can add an
inductor and make
it like a switching regulator.

Hi bruce I am scratching my head hear trying to remember as far
as I can recall it was in the order of 100HZ TO 1KHZ. The freq I
posted orignally was wrong.... Its one of these things you need to
experiment with but it does work..... If you were using a backlight
lcd display instead of the single led you would be amazed at how
bright you could make it over traditional methods while not exceeding
the max current spec of the device....

This is one area in which it is very useful.... It really comes down
to the human eye which has what is called persistance of vision.
Basically when the eye is exposed to light for a short period of time
it will remember it for a small ammount of time... The result is that
the perceived brightness is closer to a high pulsed brightness
than to the brightness achieved by standard dc power...

Best regards JD...

> KHz, all I need is the transistor and one resistor? Anything else?

Well, you need 40 resistors if you have 40 leds. If you have enough voltage, you
can put
some of the leds in series. 10 strings of 4 in series each. This can be much
more efficient
and uses fewer parts.

Here's an example from a traffic light changer. (a gizmo that flashes infrared
light at the traffic
signal to make it go green). The one I looked at had 72 leds. 18 strings of 4
each in series.
It flashed at 14 Hz with a duty cycle of 0.3%. Average current for the system was
71 mA.
dividing that by the df gives 23.6A peak divided by 18 = 1.3A peak per led
string.

I didn't measure the actual currents. At these peaks, there will be significant
losses.

I once tried this trick with a Kenwood TR-7730 & had the same problem.

>You can get a much better transmitted signal by keying the driver stages in
the transmitter,
>holding PTT down the entire time, but this might not be trivial.

I tried keying the B+ to the PA (leaving PTT closed) but it didn't work any
better. At that point I gave up on transmitting. Some day, I'm going to
fix my transverter & put up a real antenna...

>What are you going to do for a receiver? The FM receiver won't
>make much sense, but it occurs to me maybe you could use the
>AM receiver mode with the addition of a 455KHz BFO.

I had much better luck with receive. I tapped a small cap (2pF or so)
across the collector of the mixer, and hooked it to the input of a Sony
ICF-2010; then, tuned the '2010 to 10.7MHz. It worked great! Tune the 2m
radio to the nearest multiple of 5KHz, then tune the 2010 either side of
10700 to find the stations you want. Actually, since I had no way of
warping the transmitter, I left the '2010 on 10700, figuring there was no
way to work anyone not on an exact multiple of 5KHz.

1224. Re: Spice-y Oscillators

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-29 00:00:00 UTC
From: brians@opus.hpl.hp.com
Message-ID: <78tg70mte1@hplms2.hpl.hp.com>
Source record: 74025

I've always been able to get good results from Spice simulations
of oscillators. Since you're trying to simulate proven designs,
it's possible that you only need to tweak some of the simulation
parameters to improve the results. Some of the phenomena you've
described could result from the simulation timesteps being too
coarse. Adjusting the parameters of the .tran statement will
frequently solve problems like these. Also, many simulators
allow the user to specify transient accuracy parameters in
.option statements. Often, these parameters default to a low-
accuracy mode to reduce simulation time. Forcing the simulator
to use a higher-accuracy mode will help.

If you continue to experience difficulty, I'd be happy to take
a look at your Spice deck and might be able to offer some better
suggestions for your specific circuit. If you want to pursue
this route you can send me the files via e-mail.

Good luck,

Brian Setterberg

I don't at all doubt the latter, but some of us just aren't that interested. Just because computers communicate in binary doesn't mean I want/need to. Also, because of binary being the way computers operate, I do not see CW as "the root of all forms of communication". My point being that at one time the way to use a telephone was by turning the crank on a generator. Now if there were still a cult of people that used phones of this type because that is what they liked and prefered for whatever reason would you feel the same way? I'm not anti cw, in fact I am learnig code right now, but I think it needs to be put into perspective. The only way to get some people interested in code now, is to get them interested in radio first.

Possibly true, any of which I could do once I read to figure out what the hell a "colpitts osc." is. Not that I want to know. At this point however; I could assure you that CBRambo would be correct and in the wrong tense. Ham radio would be long dead as a hobby and the commercial interests would have the whole spetrum to themselves except for the small areas of "FRB" and CB.

Matt,

I bought the 1930's CD. The software interface is somewhat clumsy, but once learned is tolerable. The picture quality is very poor. Very little detail can be seen. Line drawings such as schematics are very good. Pages print very legibly, but photographs look like about four level grey scale. It's still better than not having the magazines.

I have since two years now the MFJ-16010 two knob tuner for random wire.
It's small, cheap and tunes almost everything.
I made athe same design (L tuner) using a roller inductor and a variable
capacitor, both motor driven, and it works very, very well.
The MFJ-16010 is very useful when camping because it can tune any wire
trown on the trees. I used it up to 150W without any problem.

In article <bogus-2801991359380001@dnai-216-15-121-45.dialup.dnai.com> bogus@supernews.com
(DaveC) writes:

I'm trying to get the maximum brightness from an LED that has these specs:
10-20 mA @3v.

I've tried a 650-ohm series resistor which gives me these measurements,
using a 12.5 volt supply:
16 mA, 1.8 v drop across the LED.

If I'm not mistaken, the actually current and voltage aren't important,
but the total power dissipated by the LED is. I calculate the maximum for
this LED as 60 mW (20 mA x 3 volts). With the 650-ohm resistor, I
calculate only 28 mW is being dissipated by the LED, which leaves lots of
room for improvement.

My confusion comes when I try to calculate what resistor would be best in
this circuit. If the LED draws current determined by the value of the
resistor, and the voltage at the LED depends on the voltage drop across
the resistor, how can one calculate the correct resistor without actually
trying some values and taking measurements?

Am I trying to think of the LED as a linear device (current and voltage
are linearly related), when in reality it is not?

Any help understanding not only a good resistor value for this LED, but
how to properly think about the application of ohm's law in this
circimstance, would be greatly appreciated.

Sorry for the modified return address, but I hate getting spammed. Correct
address is shown below.

Thanks,
Dave

If you wish to get the max brightness out of an led there is a way of doing it that will light it brighter than the max voltage and current it can take. Design a small circuit that puts out a squarewave in the region of 60khz to 140 khz.. If you use a 555 timer this should allow you to make the frequency variable.

Apply the output of the circuit to the base of an npn transistor for example a 2n2222. Apply Your dc power including any needed dropping resistor to limit the current to the collector of the transistor. Connect the anode of the diode to the emitter of the transistor and the cathode to ground.. ''The transistor is now going to act like a simple switch to turn on and off the led....

Tuning the squarewave oscillator you will come to a point when the led seems really bright. It will also draw less current as it is been switched on and off very fast.

The reason it seems brighter than standard methods is because of the memory effect of the human eye..... This is an elobrate way of doing it but it works very well...

bfn...jd..

: Unfortunately, those are incredibly vague specs. Is this your
: garden-variety red LED? If so, the forward voltage drop at 20 mA
: is more like 1.8 to 2.0V.

Having written a few hundred LED data sheets I would suspect the 3 volt spec is actually is the _maximum_ forward voltage the part will have at 20 mA. An individual LED with 3 V Vf at 20 mA would be a pretty crappy part but a lot of specs were written years ago when production distributions were very wide and manufacturers wanted to ship as many parts as possible.

Stephen

: > I've tried a 650-ohm series resistor which gives me these measurements,
: > using a 12.5 volt supply:
: > 16 mA, 1.8 v drop across the LED.

: That's pretty close to the 20mA rated current. Most garden-
: variety red/green/yellow LED's will be rated for a 20 or 25 or
: 30 mA max continuous current. If you pulse the LED's, things
: get more complicated, but 20 mA average with maximum pulse of
: 50 or 100 mA is typical.

: > My confusion comes when I try to calculate what resistor would be best in
: > this circuit. If the LED draws current determined by the value of the
: > resistor, and the voltage at the LED depends on the voltage drop across
: > the resistor, how can one calculate the correct resistor without actually
: > trying some values and taking measurements?

: You can't, really. Most LED manufacturers publish a forward
: current vs forward voltage curve that would take place of such
: measurements. But it sounds to me like you might not even know
: who manufactures your LED.

: > Am I trying to think of the LED as a linear device (current and voltage
: > are linearly related), when in reality it is not?

: Current and voltage are defintely not linearly related for an LED.
: A better model is that of a diode.

: > Any help understanding not only a good resistor value for this LED, but
: > how to properly think about the application of ohm's law in this
: > circimstance, would be greatly appreciated.

: A better model is a diode, with a forward voltage drop of 1.8 or
: 2.0 V. If the power supply that's powering the LED will have
: a large variation in voltage (i.e. a battery, or a non-regulated
: supply) and you're concerned about getting a constant current,
: then I'd seriously look at a constant-current regulator (take
: a look at the LM317T data sheet for a very simple example.)

: If maximum brightness from the LED under varying conditions is
: important to you, you'll really need the specs and curves for
: the LED you're using. In addition to this, a good application
: note to read is HP's series on their super flux LED's -
: particularly Application Note 1149-4, "Thermal Management
: Considerations for Super Flux LED's".

Here I go, replying to my own posts again....

>We used arcnet instead of ethernet (I said this was a long time ago!).

We actually were using 10base2 ethernet for our computer network at
the time. I figured that the bandwidth of ethernet would have been
much too high for the FM video link (as you've found), and decided
that arcnet, at 2.5Mbps, would be much easier.

There was a Novell Netware server at each end of the link, so I just
plugged an arcnet card into each, and loaded the appropriate driver to
get it to route packets between the ethernet and arcnet.

Allan.

Now, hold on a second, Tom. I'm must not be understanding what your
saying. Are you saying that when you move the weight to the far end
of the bug's pendulum, it runs *faster* (i.e., shorter dots) than when
you move it to the closest-in part of the pendulum? No bug I ever
used worked that way...

Or maybe you're talking about increasing the space to the mechanical
stops that limit how much of a "push" you give the pendulum? That I
might believe, at least to a small degree, though I've never actually
looked for that...

1246. Spice-y Oscillators

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-29 00:00:00 UTC
From: maddog@io.com
Message-ID: <36b1193a.2695408@news.io.com>
Source record: 74149

I've recently been exploring the value of using Spice Simulation programs for developing RF circuits, and so far I've had a lot of fun with it. Sure can be a time saver...

But I've had lots of unhappy results with simulating oscillators at HF frequencies (mostly 3.5 - 20 MHz). When observing the graphical analyses of the output of several proven Colpitts oscillator designs using BJTs (2N2222's), the frequency looks to be approximately as expected, but the waveform envelope observed over say, 1000-2000 cycles, looks more like a badly modulated A.M. signal. Some analyses programs (like Orcad/Microsim) require that you insert a single short pulse to "start" the oscillator, and some (like Electronics Workbench) don't need the start pulse, but all seem to have the modulated envelope. Has anyone else noticed this phenomenon? Can this be a sampling/undersampling phenomenon? Any ideas on how to correct it?

Also, when observing a single cycle of oscillator output, the output usually looks assymettrical, as if it's being clipped or limited in some way. Would this be indicative of biasing or feedback problems that should be corrected, or is this normal (for a practical oscillator to start reliably)?

Thanks in advance,
monty

I'm in agreement, Matt. Seems like they might update the software
with a search technique that's a little more user friendly, and make
that available via download from the internet. I think it would sell
CD's. (Is the ARRL listening?)

My question about using them is this:

When using "QST View" for issues prior to 1994, the search engine
seems to find all the articles on any and all the CD's in one search;
But with the single-issue years (from 1995 on), you have to load each
CD in, search it, then the next year, etc (Or else I'm doing something
wrong) Seems like there could be a consolidated index released each
year. This would also help CD sales, as it would entice someone to
buy the "1964" CD if it had a particular subject you were interested
in. (ARRL, am I all wet?)

>Looking for the solid state replacement for the 866 tube.
>
>Any suggestions?

Hello Bruce,

Personally, I just LOVE the blue glow of MV rectifiers. But you must have a reason to want to replace yours.

First, be aware that there are two tubes that can substitute for the 866. The first is the 3B28, which is a xenon gas rectifier of identical ratings. They work over a wider temeperature range, have very long life, and no hash noise. The 1616 is a high vacuum rectifier of similar ratings (double check the tube books first) that can substitute in many applications.

Or, you can build your own replacements. An 866 is basically a 10kV, .5 amp diode. Depending on the application, you can use a single silicon diode or a string of them. What rig are you planning to use these in? You might want to put a resistor across the filter choke (about 3-5 K per henry) to reduce the inductive kick on starting and shutoff.

Some folks replace the tube sockets and plate cap arrangement, while others make up plug in replacements out of an old 4 pin tube base and cap, and a piece of PVC pipe. That way you can always put the tubes back in.

I'm working on a little potable receiver. It works from 100Hz to 10.000Hz.
(Yes,.Hertz) Since it's working with dual voltage from two 9 Volt battaries,
i'm looking for very low power opamps.

In the inputstage I'm considering a INA118 of Burr-Brown.
After that i get my filtering (Lowwpass) followd by a line driver and a
headphone amp.

Any good tips?.....

> it but it works very well...

This sounds wrong. In the bad old days, the light output from many
LED's increased more than linearly with increasing current, and there
was a real advantage to driving the LED with a brief pulse of high
current.

This doesn't seem to be true of modern, high efficiency LED's, and
the last one I looked at had a fairly low absolute maximum current
limit (which didn't stop me from using it in crude stroboscope with
an 8:1 duty cycle).

The human eye is an integrating detector for optical sources
cycling faster than about 60Hz (for bright sources - it can drop
to a few Hertz in dim light, a trick I saw exploited with a
primitive phased array ultrasound imager back in 1976).

If you pulse the LED in the range 7Hz to about 15Hz you risk
inducing epileptic fits in susceptible viewers, but about that
chopping the light source doesn't affect its perceived
brightness - the eye just counts the number of photons.

Of course, if you seriously over-drive a LED you might generate higher wavelength photons - Rev.Sci.Instrum. recently had a short paper on getting near U.V out of a blue LED by hitting it with 1nsec wide pulses of current, but this degraded the junction, which could only survive some ten billion pulses (10 seconds of UV).

This sort of effect could appreciably raise the perceived brightness of a red LED, but would degrade the preceived brightness of a nominally green or blue emitter.

I wouldn't bother with the elaboration - in most cases it would be cheaper to buy a brighter/more efficient LED and you'd have some confidence about the improvement in the perceived brightness.

If you are using very low power opamps, you should be talking about
2-6 volts single sided supplly instead of 2-9 volt batteries, as almost
any opamp will work with 2 9 volt batteries.

Assuming really low power opamps, a number of them come to mind:-

LM324 : run of the mill garden variety quad opamp,
used in almost all cordless phones
that operate off a single 3.6 volt nicad battery.
MC3403 : ditto as above
RC4136 : ditto as above

TLV2074: High speed and high quality low power quad opamp
(improved version of TLO74 quad opamp)

TLC2274: high speed rail to rail but not low power, should work with
proper bias of 9 volt bat.
TLO74 : ditto as above

AD713 : high speed low lost quad opamp. May work with single 9 volt bat
after biasing.

CA3130 : This is a old single opamp. This has rail to rail input/output
and this is still one of my favorites.

LM837N : Low Noise qud opamp, It is recommended for audio apps.
Should work of a single 9 volt battery after proper biasing

I am sure a lot of people will like to add their favosites like the LT series
etc.

I have seen the exact same "badly modulated A.M. signal".
with two different SPICE programs during transient simulation.

Am I choosing ".tran" command parameters wrong? Step size?

If a SPICE analysis "false alarm", how can we prevent?

Don't have the answer to your specific problem, but after using various versions of Spice for years I have reached a few conclusions.

1. Spice models are generally inadequate. They could make them more accurate
but simulation time would go way up.

2. Spice will often tell you that a circuit won't work that will and a circuit that will work won't.

3. You can tweak with it and get better results. Talk to someone who does IC
design. They are often well versed in the legitimate uses of Spice.

4. Some Spice software converges better than others. Pspice is particularly
good but expensive.

5. I usually use Spice to gain an understanding of how fairly basic circuits
work. I also break up more complicated designs and simulate them in smaller
segments.

6. The best simulation technique is still breadboarding. The is no substitute for it and probably won't ever be. Sooner or later you must do your programming and simulation with solder and wire.

I still enjoy using Spice. I have learned a lot of good things from it, but
I have learned when to log off the computer and pick up a soldering iron.

Hope this helps.

Very cool idea.

My questions:

1) How much current for each LED should I calculate when choosing series resistors, if the max standard current is 20 mA per LED? I suppose I can use a pot and adjust the brightness, but what current value should I limit the LED to when switching it on and off?

2) If I want to switch a large number (40) of LEDs at once, what transistor would be good in place of a 2n2222 (should be max 1A capability, I think) ?

So, in addition to the components needed to run the 555 timer at 60-140 KHz, all I need is the transistor and one resistor? Anything else?

Any observations and assistance in getting this circuit running would be greatly appreciated.

Sorry for the modified return address, but I hate getting spammed. Correct address is shown below, if you choose to e-mail me directly.

Thanks,
Dave

Hello Me OM,

I use a TICK keyer chip. SMT part mounts on a PCA about one inch square. I built mine
into the base of a Bencher paddle, which I use on CW mobile. For a few $ you have a memory keyer, which runs off a 3V disc battery for a very long time.

I don't recall their location, but you can find ads for them in the mags.

Mark OM,

Matching circuits for matching the transmission line to the rig are found everywhere in
the antenna books. See any ARRL Antenna Book. Have you looked?
I would not recommend purchasing any commercially-made "antenna tuner". Keep in
mind that these tuners, inside the box, are very simple devices. Make your own and
save your money for antennas. Incidentally, "antenna tuners" do not tune the antenna
at all. What they do is to transform the driven end of the transmission line to 50 ohms
to keep solid state transmitters happy. Tube rigs with pi-network outputs do not have this
limitation. If you are feeding the antenna with a coax line, you may still have high SWR
on the line using the matching network, which will increase line losses. But on the lower
HF bands, the difference is negligible, and you won't notice it unless the coax is very
small and/or a very long run length.
It is always a good idea to research the available printed informatioin before posting a
question to a newsgroup. Nothing takes the place of homework, HI.

73 and GL,
Don

The tests I did (years ago) basically showed that the eye integrated the light and there was no brightness difference over a 10:1 ratio. Have you actually done this? Is there a particular frequency where this effect works?

1270. Re: ANTI-CW people are liberals and would want to see Clinton go free too!

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-01-30 00:00:00 UTC
From: Steve Ellington N4LQ <N4LQ@igLou.com>
Message-ID: <36b3cebf.0@news.iglou.com>
Source record: 73975
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I must take exception with this one statement since it's technically incorrect. Cw is not a MODE. CW stands for continous wave. This is "carrier" produced by a transmitter. It contains no usefull information and is by far the simplest signal one can produce. It can be produced by only one transistor or tube forming a simple oscillator.

Now by turning the carrier off and on we can use it for signaling. A code was developed by Mr. Morse and co. So now we can turn this simple circuit off and on and use it to communicate with people.

Being the simplest form of communications, the powers that be feel it is important to know how to accomplish this. Therefore, they want you to be able to draw or recognize this simple circuit in the written test and be able to send "code" with it so you can communicate.

This is basic radio. Those that feel that code should not be required are overlooking the basics. Anyone can purchase a two way radio, cell phone or pick up their telephone and communicate via voice.

Amateur Radio Operators however, are those who are capable of building and operating the simplest form of radio. This means you must learn theory, circuits and CODE or you are not an Amateur Radio Operator.

I hope I didn't ruffle any feathers here these are the facts. Yes, Amateur Radio is declining due to other interest but that doesn't change the facts.

73 Steve N4LQ

From the ARRL Handbook: "Telegraphy by on-off keying (OOK) of a carrier is
the oldest radio modulation system. It is also known as CW (continuous wave)."
"CW", as used by the ARS/ARRL/FCC is defined as the OOK mode. Others may
use "CW" to mean an unmodulated carrier. The expression "CW" is not context
free. CW/OOK is *relatively continuous* compared to spark.

Many expressions in the English language do double duty. "power", "program",
"fetch", "write", and "bus" come to mind.

Amplifying a bit on Cecil's "relatively continuous carrier" comment, CW historically and technically specifies undamped oscillations as compared with the damped oscillations produced by spark gaps exciting tuned circuits and antennas, etc. Both waveforms can be on/off keyed as a modulation process to convey information.

Paralleling the great SSB vs AM debates of the 50s was the Spark vs CW debate of the teens and 20s. Technical elucidations of damped and undamped oscillations were undertaken in QST and other technical publications of the time.

Exciting times, those days!

Hi Mike, I didn't think learning the code was a bit of fun, and I was
practicing only to get upgrades. But something happenned, after I humped the
learning curve it got fun, but it takes some determination. I suspect lots
of folks get to Gordon West's second tape or some equivalent and decide code
isn't fun, I had to give it more of a chance than that. So keep with it, we
could always use some more egotisctical hams.

Motorola has had a lot of good amplifier designs in their RF compnents
databooks & application notes. They have a lot of their data online
now. There are links to Motorola RF components at

http://mot-sps.com/rf

I don't know if the application notes are online or not. If you can
find an old (70's - 80's) Motorola or RCA RF Transistor Databook it'll
have a lot of these circuits.

Also, I purchsed a 2M amplifier kit about 10 years ago. It had the
difficult-to-find parts and a PC board. I had to provide the box,
connectors, and other common (at Radio Shack) pieces. I -think- the
kits was from Ramsey Electronics (www.ramseyelectronics.com). The kit
at the time was about $30 US, but it was worth it to not have to
mail-order all the parts. Worked pretty well, too - I used it with my
handheld to operate mobile.

Good luck with the search!

Dave

What is the recommended substance for affixing/sealing helically wound antennas? I am needing to weatherproof/beautify/secure #14 stranded copper wire to PVC/Schedule 80 pipe. I want to use the best stuff I can, that will do the job, and not affect antenna performance characteristics that much.

Hi John,

The "better" way doesn't have to involve that sort of cost...

You can build routers out of old '486 PCs and some free software (*).
(You might have to pay to get some serial I/O cards capable of
manchester or NRZI for the wan ports. Perhaps even DS1.)
Once you have a serial stream you can use the same sort of FSK modem
you originally intended to use, but now at a manageable baud rate.

(*) There are versions of Linux that can be configured to be
standalone routers that just need a single floppy disk. You don't
even need monitors once the system has been set up.
Do a web search for "linux router project".

====
That 2Mbps radio I mentioned in my other post might interest you. It
was a very cheap design from the mid 1980s, aimed at the low end of
the market, but it worked very well, and made lots of money for the
company. I heard that a company in the UK even illegally copied it.

The data signal was ITU-T G.703 compliant. (For non
telecommunications types, this is a 2.048MHz HDB3 encoded data stream.
HDB3 is sort of like AMI, but with a guaranteed pulse density. It's
used throughout the world (but not much in North America) to carry 30
x 64kbps of voice channels, plus two 64kbps timeslots for framing and
signalling.)

The Tx just took the input G.703 signal, padded it down to the right
level, filtered it a bit to reduce the bandwidth, and then passed it
to what was essentially a fm video transmitter.
This consisted of a directly modulated X band DRO. Long range models
had an afterburner.

The RF channel was 7MHz wide.

[We also did tiny video transmitters that were about half the size of matchbox, including the patch antenna. These also used a directly modulated DRO. These transmitters mostly ended up in security agencies. Some ended up in cricket stumps.]

The Rx was a litle more complicated than the Tx, but still simple. I think it was a single conversion superhet. The LO was a DRO similar to the one in the Tx. I can't remember what the IF was. It would have needed to be at least a few hundred MHz to give good image rejection. The demodulator might have used a part from Plessey. Anyway, the received video signal was squared up with two comparators (one each for positive and negative pulses), and the G.703 signal was made by combining the two comparator outputs with a video opamp. There was no need for any clock recovery or anything complicated like framing.

This sounds like you could make it fairly quickly on the bench, until you realise you need a diplexer (& possibly a circulator as well) for the antenna. Perhaps you have a spare one sitting about...

[If I sound a little vague about some of the details, it's because I didn't design any of the RF stuff in that company - I mostly worked on digital hardware. Plus it was a long time ago.]

Regards,
Allan.

it is so easy that I wouldn't care to use some old rubbish
suggest use 14MHz xo, with 2x1N4148 and BF199 (or other small RF device) doubler with tuned circuit collector circuit, 2N5109 or 2N3553 amplifier for 1W RF with pi-filter output circuit

On 10m the inductances are small, one great advantage is that one can easily make airwound coils, often trimmer capacitors are not neccessary, one only have to squeeze the turns to to adjust for ressonnance.

I made some packet radio and beacon transmitters for 10m, no problem to achieve 10W with readily available components, but for power amplifiers it is always an advantage to use 24 or 28V instead of 12V, the power gain increases

If you are interested to see an active key filter for switching driver (and low power output stage) collector voltage, send me an email, I've used this circuit for two 2m beacons sending very high speed cw at 1200-1500LPM with very little key-clicks, the beacons - LA3VHF and LA6VHF has been in operation for 10-15 years. The gif file size is only 2.81kb.

I will second the comments regarding the poor clarity of the
schematics, photos and drawings. Without using magnification,
the pages are hard to read on a 17 inch monitor--although the
the characters themselves on the pages are clear and sharp.
Mostly a limitation of the page size versus the monitor.
One other small problem with the search engine--it is based on the
index as a reference. Early QST product reviews were NOT
indexed! Spent hours tracking down the location of the
1950s product review for the SX-88. Even with the small
nitpicking, the CD sets are well worth the asking price. All
ads and covers are included.

Have you used it to transmit on? I'm curious about whether or not it will work
at 150 watts or not.

The ARRL Handbook is a good choice. You can also find good starter books on electronics and basic schematics at RadioShack.

If you can find someone with copies of the original Popular Electronics magazine that is also a good bet.

More suggestions: check a local library or a local vocational school, if there is one nearby.

This is a BIG one, can easily handle 10-15 KW !
15 uH - 20 turns of square profile silver plated wire with roller.
Actually all metal parts are silver plated as well.
Weight 3,8 kg. It is (maybe?) too big for amp/ or antenna tuner but
perfect for remote control matching unit for low band vertical or
whatever you need it for.

Bargain at $95 + s/h

Hi Fred,
It's not clear what frequency range you're intending to receive. Your post came out as a higher frequency first, going down to a lower frequency ("100hz to 10hz") is how it showed up on the newsgroup. Usually you list the lower frequency, going to the highest frequency you'll receive. Perhaps it's a typo.
Are you trying to build a vlf receiver, 100hz to 10,000 (10kHz)hz?? It would seem so, as you include a line driver and headphone as the output.

What type of receiver is this, a low impedance loop input or high impedance e-field input?
What type of opamp you wanted to use would depend a lot on the type of sensor input you planned to use.
I have built a number of vlf receivers, both loop and whip. I published a low impedance loop vlf receiver in a past copy of the Long Wave Club of America's newsletter, Lowdown. Various other designs for both loop and e-field have also been printed in this newsletter. My loop design used discrete bipolar transistors and a stepup transformer to convert the 1 ohm loop impedance to a much higher value that matched the transistor. Most e-field designs use a JFET transistor as the input stage.

One of the reasons that Amateur Radio is declining is because of the
code requirement! Amateurs do not build simplistic transmitters anymore.
Code is nothing more than an ancient hazing ritual! It's time to let it
die and increase the amateur population!

I've been intrigued by the 10 meter beacon idea and am thinking about building something. I agree that using an old CB rig is overkill. Better to whip up a simple QRP transmitter.

My question is about generating the CW. I have a number of old klunker computers around here. Can someone suggest a good CW program for this application?

I guess you could also do it with a tape recorder, an op amp/relay arrangement and a continuous loop tape.

If I do this project, I think I'll send my e mail address and ask for e-mail reports.

Any ideas or experiences on this?

Maybe it is nit-picky and digressing, but most colleges have not dropped foreign language requirements, just the engineering schools that broke out of "program" status within physics and chemistry academic departments and became "Colleges of Engineering" within universities, and some of the Colleges of Business (sic), strangely enough.

It is the advent of "professional training", rather than actual education of people that has done this. Engineers and business folk more than most have an actual *application* of say, Japanese, Spanish, Russian, for example.

At ASU, a physics major still needs 3 semesters or more of a foreign language to earn a degree. This is still fairly typical at state universities *and* private colleges.

Hello Bill and Others:

A few years ago, a buddy had made a neat keying operation made by taking a one RPM clock motor and had it rotate a printed circuit board disk that had the callsign etched on it several times sequentially. Clock motors are made to run continuously for years, and it stood up with just an occaisional cleaning of the wiper arm with spray cleaner.

All the best to all!

Doing away with CW is just another example of the dumb down of America.Outcome based education for example.The average high school grad today has about a 5th grade education.

I agree that the problems on the bands are not the no code types. If you check the call signs of the trouble makers they are mostly advanced and extras with too many years to soak up booze and kill brain cells.

IMHO the novice-extra incentive system is not broken. So lets not fix it

Hi guys,

Thanks for all the previous help. I am still working on my VCO. I am now using HP schottky diodes to provide voltage controlled tuning capacitance. And I found that the ATC capacitors are absolutely necessary. Ordinary caps don't work.

I have encountered a new problem. The oscillator does not tune smoothly as the voltage on the diode is changed. Instead the oscillator jumps in discrete steps. Has anyone heard of this? Thanks greatly.

Why is so much importance placed on CW? It is just another mode!!
The testing process should be revised to to permit demonstration
of proficiency in a number of areas rather than CW. For example,
passing a more difficult theory test.

It is time for change. CW is nothing more than a hazing ritual that
facilitates admittance into the "good old boys club".

Hi folks

I'm interested in any thoughts or ideas on a small DC to 115VAC/400 Hz design. Load varies from 5-20 watts (servos and a tiny blower motor) DC input can be 12- 28 vdc. Output wave form should resemble a sine wave to keep harmonic content (and rfi) to a minimum. Efficiency is not a major consideration. I've puttered with self excited inverters and the results were not that impressive (had to use fairly aggressive L/C filters on the square wave output which increased the bulk of the item (small size is a consideration). My latest thoughts were a simple phase shift R/C oscillator at 400 Hz driving a pair of small power Mosfets in push pull using a small center tapped 25.6 VAC 3 amp transformer and taking my output off the 115VAC primary winding. I am interested in feedback systems to affect some rudimentary voltage regulation scheme.

Thanks for ther read

73,

Bob, KE6f

Jim,

Amateur radio is not declining because of the code requirement. Amateur radio is declining because amateurs no longer build "simplistic transmitters"... It is a sad comment but true... I doubt that more than 5 to 10% of amateurs are interested in building anything...

But the really sad part is that the exams for a "General" class license are easier now than the novice license I took 28 years ago... so.. how many of you out there know the difference between a "Hartley's" and a "Collpitts" oscillator?

We need more Amateurs who are willing to put in the effort to learn Electronics, Morse Code and whatever to help advance the art of our hobby... to many are just willing to sit back and enjoy the fruits of the labor of a few... I ask you all.. how many "tower raisings" have you been to.. how many receivers or transmitters have you built (I'm not asking you to design them... just get a schematic, read it and build the device)???

I think the tests should be tougher, more code, more electronics theory, more everything... Amateur Radio does not need to be the next "CB"... we need serious hobbiest's who's ability to communicate is not based on the balance in their checkbooks to buy 10KW amplifiers. The original grant of frequencies to amateurs was because we were adding to the general knowledge base of radio theory... it's about time that we got back to our roots (And I will take the time her to thank all those amateurs who have strived to continue to advance the art of radio communications... :)

For those of you who are no-code fanatics and consider this a "Pro-Code" argument.. here is my message to you:

"-... .. - . -- ."

I have just acquired a Amateur Transmitter that I think is Home Brew but

is so well made I would love to get operational again. I hope someone
out there is Boatanchor Land can help me out by sending me a copy of the

article on it.
I will not take up space here for a picture of it but can provide one
for anyone interested.
Anyway it is a tube rig that has 7 miniature tubes and two large tubes.
It uses a 4-65A for the RF Transmit Tube and a 829 as a modulator. The
final uses an Inductituner for impedance matching. The band switch has
five positions and there is a VFO has three ranges 1.7, 3.5 and 7.0. I
would guess it was made in the 40's or 50's. There are a couple of
small tubes missing and I do not have any label's on the sockets. Does
it sound familiar to anybody out there? Thanks Don KB6GQA

Sounds like you are switching "modes," so to speak, instead of actually
tuning the oscillator. (Actually, I didn't know Schottky diodes had a
significant variable-capacitance characteristic. Are you sure you're
using the right type of diode?)

>

It depends on what's really going on. I'm thinking that something is
"taking over" as the main source of capacitance or inductance, taking
the role away from your lumped LC components at certain bias settings.
Mode-switching might be a malapropism in this case, but I know what
you're talking about. Without seeing a schematic of your circuit, it's
hard to guess what's really happening (but see below).

> As for the diodes, there is a graph of capacitance versus reverse voltage

> Capacitance varies from about 0.7 to 0.3 picofarad over the range of 1 to 4
> volts. This is just in the range I need. It is not particularly linear,
> but neither are other varactors.
>

OK, that sounds cool, but keep in mind just how small 0.3 - 0.7 pF is.
You can't have *any* stray capacitance in the circuit, or it'll swamp
the effect of your tuning diode. To put it in perspective, you can
easily measure a change of 1 or 2 pF of capacitance on a capacitance
meter just by moving the probe leads around in relation to each other.

> It is interesting to see what happens when the diodes get partially forward
> biased. There appears to be a mode that is chaotic (in the mathematical
> sense). I am using a repetitive sampling scope, and there are some
> interesting displays that look just like a flag waving in the wind.

Yep, weird things could happen in such a case. Often people wire two
diodes back-to-back, so that they can't become forward-biased at all.

Here's one thought: are you using that scope's built-in frequency display to measure the oscillator's frequency? Maybe your discrete frequency-stepping problem is really an artifact of the scope's built-in counter not having much effective resolution at those frequencies, especially if the scope relies on sampled waveforms to compute the frequency indirectly. (At 2.5 GHz, you've *gotta* be getting close to Nyquist...)

For a project like this, a spectrum analyzer -- even a relatively old, crude one -- is really the diagnostic tool of choice. Not only will it let you keep an eye on the oscillator's frequency (perhaps with the aid of harmonic markers from a known lower-frequency source), but if strays or other effects are harming your tank circuit Q, you'll tend to see a lot of noise sidebands on the analyzer that won't be easy to visualize on a scope. It is nice to have a scope that will sample that fast (sure wish I did!) but you don't want to fall into the "I have a really awesome hammer, so every problem looks like a nail" trap. :)

I tend to agree with Steve's comments. Knowing the code is an integral part of learning the basics of radio transmission and reception. How can one possibly understand how to adjust and diagnose a ssb transceiver without first knowing how to put a clean cw signal on the air, which is the simplest form of transmission known to me? I guess all of this is irrelevant if all a person wants to do is blather over the air to their buddies about the many controls on that kilobuck rig they just aquired.....and maybe not even knowing how most of those controls work?! So , since no one cares for the technical side of ham radio any more, then how much difference is there than CB? Would that make it obsolete, or just an extension of CB? It's a sad state of affairs. 73's Doug N0WVA

If you use a 20 W audio amplifier IC, the negative feedback will give
you all the regulation you are likely to need for 5 to 20 W. Choose the
right device and you could make it oscillate at 400 Hz as well.

Ok. Good point. I suppose stray inductance is bad too. But the only source is the bias supply. I am using lambda/4 skinny traces. But there could be some coupling between them, as they have to run fairly close together. Do you think this could be the problem? What is the normal practice on bias supply lines? There seems to be a lot of freedom in the choice of attachment points for the bias lines. I just joined the bias lines to the main 50ohm microstrip as close to the transistor as possible. I suppose I could separate the bias lines more and put a grounded line between them.

Well this is the only tool I have access to. But it does have a fourier transform mode that can simulate a spectrum analyzer. I will check it out and report back.

>Perhaps. I will check it out.

Well after spending some time with the FFT mode on the scope, I see that it gives significantly different results than the simple frequency measurement of one cycle of the the sampled waveform(which now seems useless to me). A lot of what appeared to be frequency jumps were not really jumps, but minor changes in steepness of the peak in the magnitude/frequency curve.

The -10db width is about 10MHZ. I think this may be near the resolution limit, and not truly indicative of the real width. At 20MHZ it is down 40 dB, and stays below that until the second harmonic which is down 30dB. This is with a 4096 sample FFT(max possible), done at the slowest sample rate that does not produce aliasing (faster sample rates have less frequency resolution).

Basically it appears that, once again, the frequency is not changing at all. When will I ever get out of this rut !!! The diode bias is only making minor (extremely minor) changes in the spectrum. Even the chaotic waveforms (that appear when I forward bias the diodes) have an identical spectrum.

Bert

Nice, balanced set of opinions. Thanks to everyone who responded!!! I still haven't made up my mind yet, but now I know what to watch out for. I can really use the shelf space a CD-ROM would provide, and pix aren't all that important. Schematics are, though. :)

Bert,

Here is one small suggestion for you. Just try pulling out the diodes! If the VCO frequency does not change much then your current layout has way too much stray capacitance in it!! If this is the case then it will not make any difference what you bias the diode at.

Another suggestion would be to pull the diodes out of the circuit and remove the diode bias traces. Next solder in two small wires (short) where the diodes were located. The two wires could then be pushed close together to simulate a tiny capacitor without worrying about the effects the bias supply traces cause. You can then manually adjust the wire spacing to change the VCO frequency for your tests.

I think trying the above may help in identifying the source of the problem.

Just my $0.02 worth of ideas to try. 8-))

>
>At ASU, a physics major still needs 3 semesters or more of a foreign language
>to earn a degree. This is still fairly typical at state universities *and*
>private colleges.

Actually, this is even true with some engineering schools, too. At
University of Louisville, for instance, in both the "Arts and Sciences"
(liberal arts) and the engineering schools require at least two years of
a foreign language (I honestly don't know if this applies for the
business, legal, or medical schools). Yes, this counts even if you are in
the engineering school, which has higher admittance standards, etc. than
the Arts and Sciences school has. (The basis is so that folks will be
well rounded.)

The *solitary* exception I know to the foreign language requirement at U
of L is in the "Engineering Math and Computer Science" (yes, they make you
take your calculus with your computer programming here :) program (and
MAYBE Information Services in the business school, which is
essentially EMACS without classes above bachelor's level and without
calculus); if you're taking EMACS you may count computer programming
languages as "foreign language" credits. Yes, I think it's a wee bit
funky counting C++ or Java or Fortran as a language credit, but I don't
make the rules here. :)

(Of course, depending on which university you attend, the "foreign
languages" you get to take may be interesting indeed! :) I know at least
University of North Carolina-Asheville offers courses in Cherokee, and
several universities offer actual credit in both Klingon and Quenya (yes,
I mean the invented languages developed by Gene Roddenberry and J. R. R.
Tolkien respectively--though you also get into some language theory in
those classes, too). I am actually sort of surprised that someone has not
hit upon the idea of offering semester-long courses in Morse Code--after
all, if C++ and Klingon are counted as languages, why *not* CW? :)

It'll work. I have had one of those since 1978. Still works, and I use
it mainly these days as a mobile matcher. You would have more fun making
one though. And if you used a quality inductor , would have less losses.

Depends on what you are trying to match. If it's a wild mismatch you are dealing with, you might have to run less than 200w. I've had mine so hot one time that the plastic coating on the toroid inductor was bubbling. I can't remember what it was I was trying to match. But say if you were using one as a line flattener, which I used to do quite a bit on the icom, and the swr wasn't that high, you could probably exceed 200w. Just depends I guess. But for average use on most all antennas with a barefoot rig, no problems. Mine still works fine after 22 years of abuse. MK

> feedback systems to affect some rudimentary voltage regulation scheme.

You should aim for a switching solution - 12V to 28V is a fairly wide
swing,
and if want up to 20W on the regulated side, a linear regulator is going
to
have to dissipate at least 27W, which is enough to be a nuisance.

A fast microcontroller chip with an ADC and PWM output - the Dallas
Semiconductor DS87C550 has all the bells and whistles, and is fast
enough, but probably costs the earth by the time you get set up to
program it - would let you measure your input voltage and you output
voltage and do both feed-forward and feed-back control. No doubt there
is PIC for for the job,
and someone on the user-group will know just which one.

Since a 400Hz cycle is 2500 usec and a decent micro can cycle better
than 10MHz, you can divide up each cycle into say 150 segements, and
adjust the
on-off ratio to one part in 150. With a 28V to 12V range, you would need
to
limit the "on" time at 28V to 65 in 150, which still leaves you able to
generate a 65-level approximation to a sine wave. You'd be chopping at
60kHz which is nothing special, but high enough that your filter
elements before your transformer won't be either big or expensive.

Clearly, you have - at best - only six-bit control over the amplitude of
any
individual segment, but by switching between say an n-out of 65 and an

n-out of 66-bit pattern over the length of a cycle you can up to this to nearer twelve bits. Sounds like fun to program.

Hope this helps.

Unless you're using one with an integrated transceiver, Ethernet
controllers are externally clocked, and can be clocked at rates
other than 10Mbps (such as 2Mbps). Some of the controllers will
even allow you turn off the Manchester encoder, which is ideal.
The Intel 82586, still commonly found on older Ethernet cards
(perhaps you can pick a few up at a swap meet or computer store
used bin), is a fully-featured serial data engine (though writing
drivers for it is not for the faint of heart).

In other words, you can probably scrounge an Ethernet card which
makes a perfectly fine serial data engine.

1363. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <794g0b$dd9@news.Hawaii.Edu>
Source record: 73788
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Possibly so, but one of my requirements is that this project just act like a "virtual 10BaseT cable", with no fiddling around with Ethernet hardware, drivers, or clock rates at either end. It is hard to live with 2 Mbps when you're used to 10 -- this will be used for file sharing and streaming on the LAN as well as Internet access. Messing with the clock rates, disabling Manchester coding, or adapting the design for specific NICs or routers renders the whole thing less general and consequently, less useful. This is 1999, after all -- it is about time someone came up with a truly general-purpose, idiot-proof 10-megabit radio link for modern LAN hardware. :-)

This weekend I successfully ran half of a 10BaseT link through an MC13155, modulating an 800 MHz VCO with an MC10116 line driver and recovering the data at the other end, after downmixing, with another MC10116. It worked the first time, with an almost-randomly-chosen voltage divider determining the deviation at the VCO. Haven't had much time to play with it since, but it appears that it will be straightforward to determine some reasonable transmission parameters empirically.

Source record: 73794

Dale OM,

Look in any ARRL handbook or other similar publication. Just reading through an issue
of CQ or QST or other ham radio magazine will familiarize you with schematic symbols
very quickly. Judging by your question, you have not studied any of these sources yet.

73 and GL,
Don, W6JL

P.S. I remember that we used to have to draw and recognize schematics for portions of
transmitter and receiver circuits, etc; for the General Class license exam.

I'm planning on building some homebrew gear and I was woundering
- can you make a pic controled oscillator?
- how do those PIC based frequency counter work?
- can you decode cw with a PIC
- can you decode DTMF with a PIC
Also are there any websites with schematics for a 2 meter transciver
or transmitter?
And last but not least are there any websites with infomation on how
to make balum's?

Hmm. What do you mean by "30 MHz DC shift" -- 15 MHz either side of
center for the positive and negative peaks? So, by Carson's rule it
would suggest that the occupied bandwidth for 10-megabit Manchester with
2X frequency headroom would be 2*(15+20) =~ 70 MHz?

>I worked on a low cost short haul 10GHz system a few years back and it
>certainly is not all fun.
>
>1. The 13155 seems to work OK -- I shifted to a new job before
>running extensive tests but it did go..

I got it working the other night, modulating an 800 MHz VCO with one
side of the 10BaseT link and recovering it after downmixing. I was able
to send packets from one machine to the other with no problem, deviating
only about +/- 3-4 MHz to either side of center. (Basically my first
guess worked, it doesn't seem critical).

>2. The filter before the 13155 is a real bitch -- flat, good phase
>response for 30 Mhz, run at 70 Mhz or so. It was easier to move up
>to 135 MHz and do the filter up there. Too wide for a helical, and LC

>This filter is critical to the noise performance of the whole system
>-- the best results were from a LC highpass followed by a buffer,
>followed by a low pass, but in the end you have to tolerate some
>excess bandwidth.

Now that is interesting. I would have expected the phase response of any filters in the system to be critical, as you suggest. I did not use any filtering at all in my quick-and-dirty test with the 13155, but I did try inserting a cheap Mini-Circuits 20 MHz LPF in my 10BaseT interface test bed (basically, between two MC10116 line drivers at either end), and the data got through it just fine. I measured the phase shift of that filter at 45 degrees at around 7 MHz in a 50-ohm system, so I don't actually understand how it could possibly have worked. The link even continued to work normally when I cascaded two of these filters in series! That must have caused the phase shift of the leading 10-MHz burst in each packet to exceed 90 degrees, but it didn't seem to bother anything at all.

I have ordered a couple more Mini-Circuits filters, low-pass at 200 MHz and high-pass at 100 MHz, to put in front of the 13155. My guess was that these would be sufficient, operating at a center frequency of 150 MHz. The highpass->buffer->lowpass scheme is identical to N6GN's, and I was planning to stick with it.

>3. Consider changing the data to another modulation eg back to NRZ
>can be done with a few gates and flip flops -- halves the bandwidth.

That might work, but wouldn't it do bad things to the initial 10-MHz clock-sync(?) burst? (Not that my 20 MHz filter *wasn't* doing bad things to that burst...)

>. Get the pulse shaping correct first -- ethernet drivers have FAST
>ansition times -- after all they drive long cables.

The MC10116 line drivers used by Glenn's initial 2 Mbps project seem to work well at 10. I'm using MCL T1-1 broadband transformers for isolation between the 10116s and the 10BaseT jacks.

>. Remember that one direction with a GunnPlexor will be inverted.

True, but I was also surprised to note that at least with the two 3Com EtherLink III cards in my test machines, the polarity isn't important. The cards seem to recognize and compensate for polarity inversions. That does make the testing easier, as it eliminates a potential way to screw things up, but I wonder if it is true of all 10BaseT cards in general or just the model I happen to be working with?

>. The 13155 is not the only way to go -- some of the RF
>discriminator IC's used for earlier satellite TV work well try Mitel
>for the RF discriminators from GEC Plessy. I forget the part number

>but I can look it up.

I'm pretty happy so far with the 13155. My initial test was conducted at a center frequency of 90 MHz, but it should be fine at 150 as well according to the data sheets, and you couldn't ask for a simpler circuit.

>If I can help further email me...

Thanks -- any clues I can get will help. :-) Would rather keep the thread on the newsgroups if possible, though, as email doesn't show up for posterity's benefit in dejanews.

>PS : You can phase lock a Gunn device cheaply using Fujitsu or NEC
>dividers that work at 14GHz -- let me know if you are interested in
>the circuit.

I'm expecting I can just AFC the tuning port with a low-pass filter off the differential output of the MC13155. There'll be an opamp on those lines anyway to drive a tuning meter. One nice thing about a single-conversion design (as opposed to N6GN's) is that AFC needs to happen only at one end of the link!

In the good old days one could
find small differential trimmer caps.
Simply a matter of adding two fixed
caps, a NPO ceramic to one leg, a
Negative coefficient ceramic
cap on the other. The differential allowed
drift compensation without affecting the
oscillator frequency.

There were two simple, low cost circuits shown in recent ARRL handbooks, one of which would probably work with the 850. I think they used the MAX232 chip. Substituting the MAX233 will eliminate some of the external components

That's a good point; the original N6GN design was DC-coupled throughout, but I've taken the liberty of using broadband transformers at both ends of the circuit for isolation purposes, and blocking capacitors between the FM detector and line driver chips. AC coupling simplifies the design considerably over the circuit in Glenn's original article.

I'm not obsessed with optimizing bandwidth usage, anyway, as long as it works.

That is correct, it is not. The voltage will stay around 1.6 to 2V no
matter what the current is. So you subtract that voltage from the
supply voltage and divide by the current to get the correct resistance.

Probably the biggest obstacle to this idea isn't technical or economic, but regulatory. I am not sure what the licensing requirements are, or if even an amateur license allows one to chew up 50, 60, or 70 MHz of prime 24 GHz real estate with something like this. I'll have to look up the relevant FCC regs one of these days. It is not a big deal in my particular case since I only need to run enough ERP to make it across a parking lot, but widespread deployment of such a system would undoubtedly have to be done entirely at the users' risk, legally speaking.

My suspicion is that the ham ID requirement could be easily met by simply keying the carrier in a quick "_.. . _._ . ..._. _.._" pattern every few minutes. That will play hell with my Quake game, though, so I may put it off until I get my first pink slip in the mail from the FCC. :-) In all seriousness, though, the legal aspect of the problem is one reason I want to learn more about what determines things like the minimum usable bandwidth and such.

>

I dunno. 1 Mbps = about 130 KBytes/second, and I definitely get closer to a megabyte per second just copying files in DOS across Windows boxes on 10BaseT. Our net connection at the office is only a T1, so 2 Mbps would be fine for Internet work by itself. The trouble is, nobody uses 1- or 2-megabit network cards anymore. The ones that sell for $20 at CompUSA are all 10-megabit 10BaseT models. Supporting anything less than 10BaseT is a waste of time, on the grounds that it's obsolete technology.

> 1000BaseT.
>

Right now I don't have any interest in supporting 100-megabit or faster standards. 10 Mbps is just an incremental jump over the older 2 Mbps designs floating around, but 100 Mbps is much more than just a faster 10 Mbps link. 100BaseT uses multiple pairs with all kinds of funky multi-level quadrature modulation schemes and such that I don't even want to think about at this point. I am not sure that there are any off-the-shelf radio modem chips like the MC13155 available for 100-megabit service.

Sounds like a very good point; minimize the traffic on the wire, and you end up with fewer retries. The dual-Gunnplexer approach I'm using isn't really "full duplex" -- because each Gunnplexer serves as the other's local oscillator, each station can only receive when it isn't trying to transmit. Consequently I can imagine that excessive net traffic at the "office" end will lead to substantially degraded performance at the "home" end, even when the traffic isn't intended for the remote site!

If this turns out to be *too* big a problem, I will probably just order a couple more Gunnplexers and put half of the link on 10 GHz with the other half on 24. Either that, or use a couple sets of cheap VCOs to put the link somewhere between 1 and 2 GHz. The latter, of course, would eliminate all hope of legitimacy from a regulatory standpoint.

That's not true. For gigabit ethernet, there's fancy modulation etc.
But for regular 100BaseT there are only two pairs used, and it's
basically the same as 10BaseT.
Manchester encoding is used for 10BaseT.

> > Venture capital, anyone?

Already being done by the same people that make the 10MB chip, and some
others that have been buying this chip from the same mfgr. I forget, it
might be Harris. I've been on their web page, so you should be able to
find it on the net.

Even in NLD, which I take to be Dutch Guilders, this guy has everything
priced two to four TIMES the price of everyone else, and I checked three
major catalogs!! 8.50 NDG for a P8031AN ?? This is a sub-US$1.00 part!!
27C256 12.90 NDG ?? I don't think so!! This guy is an opportunistic
rip-off!! I hope people who see his site shop around first!!

Wow, that's not what I'd always heard. So it's just two differential
pairs (4 conductors in all), just like 10BT?

I was a little hasty on the original price since I did not sort the
crystals, hell it was hard enough reading the frequency off the things and I
have 20/20 vision. So I decided to change the price to $2.00 a piece plus
USPS. On the Heath Crystal Filter make me an offer and it is yours. I just
hate to throw these things away.

>using the right type of diode?)

Ok, so what is the cause of "mode switching" and how do I stop it?

As for the diodes, there is a graph of capacitance versus reverse voltage
given in the data sheet. Apparently my application was anticipated.
Capacitance varies from about 0.7 to 0.3 picofarad over the range of 1 to 4
volts. This is just in the range I need. It is not particularly linear,
but neither are other varactors.

It is interesting to see what happens when the diodes get partially forward
biased. There appears to be a mode that is chaotic (in the mathematical
sense). I am using a repetitive sampling scope, and there are some
interesting displays that look just like a flag waving in the wind.

Hi Dana,
Yes, I agree about the underclocking. I didn't think you
could still get cards like that anymore, but if you can, go for it!
Modern transceiver chips will have an onboard PLL (or more likely, a
delay locked loop) which will have a limited pulling range.

I'm not sure why you'd want to disable the Manchester encoder. Sure,
it'll halve the bandwidth, but it'll make clock recovery at the other
end quite difficult, as ethernet controllers don't scramble the data,
which means that if you send a packet of 1500 zero bytes, you won't
receive any data transitions for 1500 x 8 = 12000 bit periods. This
is (more or less) impossible to decode.
You'll also lose DC balance, which can upset AFC, etc.

1401. Ceramic resonnators in bandpassfilter

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-02 00:00:00 UTC
From: la8ak@online.no
Message-ID: <36b65495.30612893@news.online.no>
Source record: 73924

Measured some resonnators tonite, to check the possible use in parallel resonnance application filters.
seems not too bad selectivity with ceramic resonnators instead of xtals for off-frequency standard receiver, but need at least two elements (I have 500 items) for sufficient stop band selectivity.
Measured tonight, see circuit attached. It seems that notch frequency varies with different parallel capacity load, and it is possible to tune parallel resonnance 'over' unloaded series resonnance frequency

The circuit consisted of a terminated input with 0.7pF input coupling capacitor and 0.7pF output coupling capacitor and a very high impedance amplifier to drive the measuring equipment. The device under test is connected between the two capacitors and ground, it is shunted with 0-140pF (100pf fixed and 40pF trimmer capacitor) - 2kB gif file is available to shown the simple block diagram.

Device: CSB250D Murata
tunable range 0-140pF: 249.24-251.15
Notch with 'zero' loading: 250.19kHz
selectivity:
248.0 -40
249.0 -46
249.5 -37.5
249.8 -23dB
250.0 0dB
250.2 -20dB
250.5 -26dB
251.0 -28.5

Device: Murata CSB500E
tunes 0-140pF: 509.59-516.93kHz
notch with 'zero' loading: 500kHz

Device: Murata CSB480E
tunes 477.36-482.94kHz
notch 478.37

Measured using Siemens 3W517 Pegelsender, D2006 Selektive Pegelmesser, frequency counter and 50 ohm RF mV-meter.

next experiment is two element bandpassfilter
I need a 250kHz filter for off-frequency standard receiving longwave broadcast stn, the filter should be as sharp as possible.

Hi Jim,

I agree about that last statement. If you could make a cheap
commercial quality "wireless ethernet bridge", it would sell like
hotcakes. When I used to work for a microwave comms company, it
seemed every second customer request would be for such a product. We
could sell them microwave links for 30 phone channels (this was one of
our main products), but we had nothing for their computer networks.

The typical customer would be a small or medium sized business that
had a head office, and a new, small office within a few km of head
office. They wanted to extend their PABX and their computer network
to the new site, without having to pay phone company rates on data
lines.

I did some market research, and came up with the following
conclusions:

1. The box at each end will simply plug into the ethernet and need no
configuration. Customers don't seem to like configuring bridges.

2. You really don't need 10Mbps. *No* 10base-anything ethernet can
equal this figure, even asymptotically. You can get pretty close in
bursts with a modern server fed from an ethernet switch though. This
would not be a typical application.
I contend that your "file sharing and streaming on the LAN as well as
Internet access" would suffer little subjective degradation at even
1Mbps. Well, maybe. There will definitely be times when you notice
the difference, but most of the time you won't.
It helps to filter out packets that don't need to traverse the link in
this case.

Most business users are just happy to have connectivity.
[I should point out that my research was done before web browsing became a significant part of network traffic. Even so, all Internet traffic for a small to medium sized company will get funnelled into a single feed of typically < 1.5Mbps. Even ADSL (in practice) doesn't get close to 10Mbps.]

2b. Even if you get 10Mbps, what happens when you connect to a 100BaseT network? Will you need 100Mbps then? Repeat argument with 1000BaseT.

3. It is desirable to not share collision domains across the two ends of the link for three reasons:
a. A shared collision domain will limit the distance you can transmit (due to the maximum delays allowable in the ethernet spec) to a few km (IIRC). If you don't share the collision domain, you can transmit over any distance.
b. This saves link bandwidth by not transmitting useless information (which only matters if the link rate is < 10Mbps).
c. The need to send collisions across the link means that when the link gets noisy (and they all do, at some time) then you will trash the network at each end.

4. The conclusion was that you need a router, bridge or switch (preferably with packet filtering) at each end, regardless of the data rate. Since you can build one with a few chips costing perhaps US$40, this wouldn't seem to be a problem.

Venture capital, anyone?

Far Circuits in Dundee, IL also sells printed circuit boards for many of the plans found in the Motorola Application notes. They also sell a wide variety of other printed circuit boards. E-mail at farcir@ais.net. Phone: (847)836-9148

Since many of the cool plans rely on precise printed circuit board paterns for the input and output matching circuits, this is a good way to save a bunch of time and frustration, while getting your hands dirty.

Microchip has an excellent website. They are the mfr of the PIC chips. You can download all sorts of software and libraries. Parallax (www.parallaxinc.com) has a good site with links to hosts of STAMP applications. The Basic Stamp I and II are based on Microchip IC's with a built in compiler. Micro-Engineering Labs has an excellent site also with great links. There is also an 8 bit microcontroller news group! All the above are easy to find.

The Stamp is very easy to program, but comparatively slow. This isn't a problem in the types of applications you mentioned and some of the solutions are presented right on their webpage.

For a frequency counter you might be better off using an off the shelf Harris Semi chip like, I believe, the 7217, if all you want to do is count. If, however, you want to use a Voltage to frequency converter as part of an analog to digital converter, then the Stamp can fit the bill. I believe it counts pulses in 10uSec intervals.

Huh? A0 is the simplest form of transmission. Generating a clean
carrier requires no knowledge of Morse Code, though it does require
some knowledge of RF circuitry.

> between them.

Backwards tuning is a common symptom in vcos. It happens when parasitic
parts of your circuit get into resonance and your transistor likes this
resonance better.

Make sure that your stripline resonator is the only thing in the VCO
that has a Q worth speaking of. Resonant chokes are an invitation
to desaster.

Try to modify the circuit so that one side of the tuning diode is at
ground
if this is not already the case. This leaves you with one choke to feed
the tuning voltage to the diode. The size of the choke should be like a
"thick"
0805-resistor with 3 or 4 turns of 0.1 mm wire wound closely. Put a 470
Ohms resistor in series to spoil the Q of the coil. Attach the bias
choke at a low impedance point.

Use the smallest de/coupling capacitors possible. 100 nF/1206 has a
series resonance of 7 MHz. Above this frequency it behaves like an
inductor.
You could easily hit the series resonance of an innocent looking
1000 pF capacitor with your VCO.

Avoid back-to-back tuning diodes until you have everything else
under control. While they may help the large signal behaviour they
make biasing more complicated.

Common low cost varactors for this frequency are Siemens BB801 / BB803.
Schottky diodes may work, but are optimized as switches/rectifiers.

regards, Gerhard

HamMan's post is liberally sprinkled with the word liberal.

First, the amaterur radio service is a grant, privilege, license program, whatever you want to call it, established by ALL U.S. citizens through the FCC. If a large number of Americans want to establish a licensing program without Morse Code requirements so be it.

As for Clinton, I don't give two hoots about the man BUT if the President of the US can't get laid, then I don't know who can.;-)

As a no code whiner I am not out to trash other people, only to make the radio amateur program accessible to more U.S. citizens.

Dropping Morse Code doesn't mean you don't have to pass any test. A one hundred question test with more radio theory would be a more appropriate test. Knowing or not knowing code doesn't enhance my knowledge of operating a station safely and competently.

When the FAA made the instrument rating easier to obtain pilots howled how the system would be degraded. Nothing of the sort happened. The requirements for obtaining a ham license can remain stringent without requiring code--IT IS KNOWLEDGE, COMPETENCY, SAFETY AND SKILL THAT SHOULD NOT BE COMPROMISED.

Why not incorporate a "practical" test and have the applicant identify resistors, transistors, a SWR meter, or whatever.

I don't know if this bears directly on your problem, but. . .

In virtually all the books and articles I've seen on negative-resistance oscillators, the analysis is blithely done at a single frequency. But my eyes were really opened when I did a Super-Compact sweep of a microwave oscillator I had designed. The input resistance was negative over quite a wide range of frequencies, and a given reactance would resonate it at two or three different frequencies. The combination of the collector load (including DC feed system as well as intended load), transistor parasitics, and emitter circuitry (it was a common-base design) had multiple resonances over the range where the transistor had gain. It took a lot of time and effort to design collector and emitter feed systems which would keep the emitter resistance positive or no more than slightly negative except at or near the frequency I wanted it to oscillate. My model was pretty good -- I could quite accurately predict oscillation at particular frequencies as I modified the circuit.

This is something you might need to look into. In my experience, negative resistance oscillators can be a whole lot trickier than most of the articles and books would lead you to believe.

Hi John,
Do you remember my post of a few days ago which described an
FSK 2Mbps X band full duplex radio? It used a channel spacing of
7MHz, and had -80dBc out of band Tx spectrum. This was legal for that
band in Australia (where it was designed). So you can definitely do
what you want without using too much bandwidth.
(This performance required filtering the baseband Tx signal before the
frequency modulator (an X band DRO). The Rx baseband signal was
cleaned up with comparators.)

I'm not sure what the FCC will allow, but in Australia there are
certain bands which do not require licenses if the transmit power is
below a certain level (something like 0dBm). This much power can get
your signal quite far if the dishes have enough gain. We just
happened to make dishes too, so they were just lying around.
Sometimes you get lucky ;-)

I know that the FCC have allocated some bands for low power spread
spectrum comms, for applications such as lans, etc. The Harris PRISM
chipset will do 11Mbps at 2.4GHz, but it might only just make it
across your 150' parking lot. You might do better with some decent
antennas.
http://www.semi.harris.com/prism/prism.htm
Why don't you get one (pair) of their evaluation boards?

If you don't want to use spread spectrum, I once designed a 38Mbps
full duplex radio modem for 15MHz wide channels. Don't try this at

home, kiddies! If I was doing it again, I would probably use some of the newer digital radio chipsets from Harris, Analog Devices or Graychip. They take all the fun out of the design :-)

Regards,
Allan.

Thanks Emil,
This was posted to amateur radio and homebrew newsgroups.
Do you really think John can just whip up a QAM64 modem with a soldering iron and some bits and pieces from around the lab?
QAM-x for x > 4 will require mountains of digital circuitry in both Tx and Rx. To design a "practical" QAM modem from scratch will take a small team at least a few months. Trust me, I've been there.
It will require adaptive equalisers in the receiver to cope with multipath across the carpark. Symbol timing recovery is a pain. You will need some sort of convolutional FEC (trellis coding) as well as Reed-Solomon if you want any sort of useable BER. The designers will need to be familiar with high speed ADC and DAC designs, know how to design high speed digital logic, need a high speed digital CRO for debug, be able to handle high pin count surface mount chips, have an FPGA or CPLD development environment, etc.

FSK has the advantages of robustness, simplicity and low cost. It also interfaces simply to manchester encoded signals.
FSK starts to sound quite attractive when you take this into account.

Emil, I notice you work for Siemens in Austria. Do Siemens make QAM chipsets? I didn't find any on the web.

Allan.

Hi John (again),

In other posts in this thread, I mentioned that the Tx bandwidth can
be reduced by pre-filtering the baseband signal.

The bandwidth can also be reduced by dropping the baud rate, by
increasing the number of bits per symbol, without the complexities of
a QAM modem. With a simple circuit inside a small GAL, you could
perhaps go to 4 level FSK, which would give 2 bits / symbol, and halve
the bandwidth. (Actually, this would reduce bandwidth by a factor of
4 from the original manchester encoded signal.)
You could go to higher levels of M-ary FSK, but anything beyond 4 will
probably require a digital slicer in the receiver. Four levels can
easily be decoded with a simple analog comparator circuit with
adaptive thresholds.

You will also need to scramble the data, to get around the threshold
drift problem on packets with long runs of 0s or 1s. The receiver
will use a self-synchronising descramber.

Symbol timing recovery will likely use transition detectors on the
comparator outputs and a PLL. You could do this digitally (if you
have a reference clock high enough) or you could do it with an analog
PLL.

Lets compute the baseband bandwidth for 4 levels at 10Mbps.
Assume rolloff factor in RRC filters gives 40% excess bandwidth.
Symbol rate = 5MHz.
Baseband Bandwidth = 3.5MHz

This really is a simple, cheap circuit! Reply if you want more
details.
Actually, I'd love to do the full design. Unfortunately my current
employers would probably not like it if I suddenly stopped designing
frame relay processors and started designing modems.

You might want to take a look at Antique Electronic Supply Online!

"http://www.tubesandmore.com/"

They have lots of tubes for sale at what appear to be reasonable
prices.

Hmm. "DC feed system". That sounds a whole lot more sophisticated than what I have. The text books seem to neglect this. I would love to hear more.

I am not modeling the feed system. But without it, there is only one resonance, and there is negative resistance only near resonance. But clearly my model is not complete.

>>If you wish to get the max brightness out of an led there is a way of
...>>Design a small circuit that puts out a squarewave in

i remember hanging a probe on an led some 25 years ago and seeing a
pulsed waveform. my reason for looking was that the common story
was the leds were _all_ pulsed, to give a higher apparent brightness.

of course, these device were just coming into common use and quite
expensive, so while the waveform was indeed pulsed, i cannot really
say that it was not for some other purpose, like extending life,
or allowing cheaper total cost by mitigating any effects of 20%
resistors in the bias circuitry.

perhaps the device lasted longer at some level of "perceived" or
absolute brightness with the extra circuitry. one thing for sure,
they didn't add components just to test some design theory. of course,
now, this may be a long past issue...YMMV.

I don't know of any web sites, but, I seem to remember that there were several articles in QST and 73 magazine, years ago, about homebrew paddles. The one's that I remember used blank printed circuit boards for the paddles, because of their stiffness. Mabey someone could look up some articles from the QST CDRom set.

Good Luck,
Martin

Yes, I'm in the same boat -- my current employer would look dimly on a long-term research project to develop a multi-level FSK modem when I'm supposed to be writing software. :-) That Harris link from your other post looked intriguing, looks like they have a lot of good app notes that might help me out even if I don't cough up the $$$$ for their eval boards.

That would certainly be nice, if somebody had a black box chip to do
it. ECL in -> FM modulation signal out, and vice versa. But as noted
before, I don't get paid for this stuff. I only want a decent game of
Quake, not a doctoral EE research project. :)

Steve,

Have you checked at a Radio Shack? (Presuming you are located near one)

I have an old RS portable citizen's band radio that uses two dummy cells
when using 1.5V AA batteries instead of 1.2V AA rechargables. They are
a lead-like cast dummy with a thin body and normal sized top and bottom.
Perhaps they can get them for you as a replacement part ... radio is a
TRC-209, #21-1660 if that helps at all.

Greg Halpin

>

The problem is not with the type of signal, but with the frequency and power level.

The power level on a cordless telephone will be so low that it is of no concern. You will get more radiation during a holiday trip to the Swiss Alps!

I do not know what types of phones are available in the UK, but my next cordless phone is going to be a 900 MHz digital spread spectrum phone. They have the best operating range and better privacy than any other.

Try Radio Shack. Some of theeir CB walkie-talkies come with
two dummy batteries (so the user can load either ten NiCd's
or eight alkalines + two dummies). They surely don't sell
the dummy batteries over the counter, but I'd bet they can
order them as a service part for the CB W-T's. Try it!

Steve OM,

Why not just make two out of wood, with a jumper? Cost is zero.
I made a "false" battery pack for my portacle VCR and camera (no,
not a 'cam-corder'), by cutting a block of wood the same size and shape
as the sealed battery, complete with two copper contacts and leads.
This enabled me to use the setup off my cigarette lighter jack in the car.
Another zero cost solution (my favorite kind!).

73,
Don, W6JL

I've made them before. Take a piece of copper or brass tubing that's the
right size to
make connection at the positive end. Cut it the right length.
Take a piece of wood dowel the right diameter for the battery case and drill a
hole
down the center for the brass tubing. It's tough to get the hole centered, so
make it
oversize and use hotmelt glue to hold the brass in the center.
Can get all the parts at a hobby store. or hardware store or...

You can accomplish the same thing by cutting a slot down the side of the dowel

and running a wire between two thumbtacks.

US freight costs are the killer to our business. We import
electronic stuff from the US. One package cost USD180 to
airfreight here from the US. It was faulty on receipt and
had to be sent back which cost USD30 equivalent. We deal
with several countries but the US is the disadvantaged
source simply because of its transportation costs.

+AD4- I am looking for replacements for some old diodes. The part
+AD4-numbers are 1N191, 1N458, and another that is marked only as a 500ma
+AD4-silicon.

The 1N191 is a germanium diode rated for about 100 volts and around 100 mA.
The 1N458 is a silicon diode with a voltage rating of 200 volts. Depending
on how these are used, ordinary 1N4007 silicon (1 KV, 1 A) diodes +AF8-might+AF8-
suffice. The forward voltage of the 1N4007 will be about twice that of the
1N191. And the switching speed of the 1N458 is faster than a 1N4007. If
either of these properties is critical, you will need better replacements
than the 1N4007.

Does anyone know the availability of any "dummy" AA cells?
(I've seen them in the past - they are plastic forms the same size of
an AA cell, with a metal strip connecting the top and bottom contacts -
basically a specialized jumper!).

I have a AA battery pack for a handheld radio (Kenwood TK-250) that has
spaces for too many AA cells (excess voltage would damage radio). I need
to insert two "dummy" AA cells to act as jumpers for these extra spaces.
Already tried to solder jumpers in place - can't do it due to the metal
they used for the contacts.

Thanks for any assistance and advice!

If you get down to the bare iron and program the PICs in assembler,
you can get access to all sorts of capability that's used for
other things in the Basic Stamp.

The counter prescaler in a 16c5x PIC is good for (maybe) 50 MHz,
independent of the CPU's timing crystal, (more or less). This divides
by up to 256 and then feeds the 8 bit counter register. So the program
only has to worry about counting the number of times this last counter
overflows, which can happen as slow as 65,536 times slower than the
input at the pin. Slow enough for the sofware to deal with it.

One of the hobby magazines had a PIC based frequency counter as a project
3-6 years ago. I think it was Electronics Now.

1465. Regenerative & super-regen recievers, filters, grid-dip meters?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-04 00:00:00 UTC
From: Scott2@mediaone.net
Message-ID: <HC8u2.11877$jd2.27012573@rmnws01.ce.mediaone.net>
Source record: 73886
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

I've found a grid dip meter is a very handy tool to have for checking filters and other circuits. The grid dip meter (an oscillator with a sensitive current meter to measure RF absorption peaks) in the ARRL Handbook also functions as a tuned RF field strength meter when oscillator current is cut.

I've read regenerative recievers work on this principal, but suffer from poor dynamic range, noise, and two-handed operation to balance the regeneration which changes with tuning. But for cheap test equipment this could serve very well.

Wouldn't it be nice to use a microcontroller (PIC) to control the tuning and Q (damping) of a filter/oscillator? By pinging the circuit with a step, and timing the ring period, the Q could possibly be adjusted for very high (10,000?) values. It would be very nice for the following applications:

* Spectrum analyzer type oscilloscope probe
* Clean RF sine oscillator, & sweep generator
* Antenna and return loss measurements (grid-dip meter)

The single-chip controller PIC might even count frequencies (under 50MHz without extra prescaler) and send RS-232 data to a computer for detailed analysis & display. I would hope the RF spectrum from 1MHz to 1GHz could be covered with 7 transistor oscillator circuits, each covering a 3:1 frequency band.

As a test I've tried tuning a 1KHz - 500KHz active-filter Biquad's (similar to state-variable) integrator resistors with mosfets. Found I could get over 2 decades of tuning with the same cap, but the mosfet voltage-variable resistors distorted (even with biasing resistors) and caused oscillations at high frequencies. The gain of the loop affects the phase angle of the integrators, so damping and tuning interact.

This was from a test on a breadboard with a ground-plane. I don't know if its the breadboard or the 4007 CMOS mosfets that are making this filter oscillate when my spice model (which is using regular integrator resistors) says it should be stable.

Anyone got a 4000-series CMOS library for Orcad pspice? I need the 4066, 4069, 4049 & 4007 device models bad.

I'm wondering if this is possible, if it has/is being done. Maybe an impossibility because of complex and chaotic frequency-damping control loop, if the relatively tame 2nd-order tuned circuit's response is demonicaly posessed by evil amplifier and varactor reactance and

non-linearity.

My guess is that I'll spiral in and converge on a desired frequency &
Q, unless I use a clever algorithm that tunes a 2-dimensional
pole-zero space, with compensation for varactor or Fet-VVR
non-linearity.

Do you know of any radio's or test equipment commercial products that
use regenerative/super-regenerative filters? Suggestions?
Too lame for a clever sig

hello,

i am interested in obtaining the build sheets and schematics for a six and two meter homebrew transverter. i would like for it to use the 20 meter band from my hf transciever. i know ten tec makes the kits but i am trying to be very thrifty (cheap!) and carry on the tradition of homebrew.

can anyone point me in the right direction? are there any web pages to support this? anyone interested in being a long distance elmer??

pls reply e-mail tnx

Solder mask. It is normally printed or silk-screened on. Using it at home
is usually not worthwhile for just a few boards.

Message-ID: <020901be502a$0aeceb60$0ee44781@default>
Source record: 73891

Hello to all and thanks for reading.

I am operating a remote controlled HF station and want to add a solid state "Skywalker" amplifier. To protect the amp, I need a way to prevent transmitting into high SWR conditions. My thoughts are to have some type of SWR Alert/shutoff if the SWR exceeds 2:1. Anyone know of a circuit which will fill the bill?? Perhaps there is a commercially produced device available for such application.

Greatly appreciate any advice. Thanks and 73,
Sam--K8WVA--

I do not recall the part number off the top of my head, but I recall
the Yaesu FT-847 uses a single quad FET mixer for LF through UHF.

I am interested in the same thing, and have slowly (very slowly) been
collecting parts.

Most of the parts to build a QRP transverter can be obtained from
Minicircuits. You will have to obtain/build a crystal oscillator yourself

There is also Down East Microwave at www.downeastmicrowave.com. They sell
all kinds of parts and kits for everything from 50 MHz up to cosmic rays
(well, not quite I guess)! They also have the power amplifiers and LNAs to
get more performance out of the above mentioned QRP transverter.

>73,
The 100TH is not easily used in transmitters.
The transmitter will most likely require plug-in
plate coil with inductive link coupling, a 2 section
plate tuneing capacitor and a neutralizing capacitor.
It is not very well suited for grounded grid operation
like the 572B or 811A.
Are you wanting to make a 1930's style transmitter
or just happen to have a tube you want to use to
build a transmitter? If it is the latter I suggest that
you trade it in on a 4-125 tetrode (similar plate dissipation)
and make a 1950's type of transmitter. If you choose a
big enough filament transformer you can upgrade to
the 4-250 or 4-400 with out changing sockets. Just need a
bigger (more current) B+ supply.

Before you get all the headaches of "improving" your unit, check out some alternatives which will do about the same thing with less chance of ruining the resale value. Two items that come to mind are speech compressors and amplifiers.
A friend of mine related a story where he was receiving a S9 signal from a station running a 1KW amp without speech compression. Taking the amplifier out and running 100W the signal was (of course!) much lower. Turning on the speech compressor with 100W the signal was back to S9.

Well, by your standards, then Radio Shaft (heh-heh) should be taken to task for ripping off the public for selling 9 cent transistors for 2 dollars, etc. That's even MORE markup than this Dutch guy!

I see nothing wrong with him charging those prices, because the laws of supply and demand will assure that he won't get any business, plain and simple. What you should be doing instead of naysaying is start your own parts supply and compete against him; just imagine all those Ferengi PROFITZ!. But then, I've never known you to take that road, you're a dyed in the wool naysayer.

Almost as bad as the hospitals. The past week I saw one news peogram, I
believe it was Dateline, take a hospital to task for charging something
like lebendey-leben thousand percent profit on an 11 cent Tylenol
tablet, for example when they billed the patient. If you like to
complain about ripoffs, then complain about the ones where the victim
doesn't have a choice about it.

In case the person asking the question might not know what solder mask is, it's put on the board to restrict the places that get solder during the automated wave-soldering process. It saves a lot of solder by keeping it off all the areas except where it's needed, and also greatly reduces problems with solder bridging between conductors. It wouldn't be very useful on a hand-soldered board, although some coatings might provide a degree of corrosion protection.

If the LED has to be @ 20mA and its voltage drop is 3V then if you use a 12.5 volt supplythere will be 12.5-3 = 9.5 V over the resistor. Using the formula R=U/I the resistor has to be
9.5/0.020 = 475 Ohm

> My confusion comes when I try to calculate what resistor would be best in

The 1N191 is a germanium signal diode, and can be subbed by just about
any of the 1N34 replacements. The 500mA rectifier diode can be subbed
by a 1N4004 for example.

The 1N458 may be a Zener? Or else another small signal diode? I can't
remember. Try www.nteinc.com for sub info.

Be careful you don't over tax the SB-401's power supply.

PS - I built an SB-401 when I was in high school in the 1960s.
It was a better xmtr than the Drake T-4X I owned afterward.

Agreed ...

>
>The power level on a cordless telephone will be so low that it is of no
>concern.

This is true for the analog (FM) 900 MHz phones and the digital 900 MHz
phones which are not spread spectrum. They are constrained by Part
15.249 of the FCC rules to a field strength of 50 mV/m at 3m ... which
works out to about 1/2 a milliwatt of output power with "normal" antennae.

Spread spectrum phones, on the other hand, *can* under certain
circumstances legally output as much as 1 Watt ... though the vast
majority of phones in production only use 100mW or so maximum,
as a trade-off between range and battery life.

Some of the "high-end," longer range phones put out 250mW to
400 mW when they are in their highest power mode (most do power
control, reducing power to what is needed, again to maximize battery
life, so they only go into their highest power output mode when you are
far from the base and need the additional power to get the range.)

However, I wouldn't be concerned ... even a max power, the flux density
from SS cordless phones does not consitute a health risk ... otherwise, the
FCC would not have authorized those power levels.

It's solder mask, to preventsolder from sticking to places where
it's not needed ... this reduces solder consumption and also
helps to prevent unwanted solder bridges (shorts), improving
process reliability and reducing manufacturing costs.

I have built a number of HeathKits that had a bluish coating instead of
green.

I found it highly comforting regarding the solder bridge problem.

Sorry Charlie (or is it Baby Huey?)

There are no "amateur telephones" used on TexNet or any other networks that I am involved with.

We don't use any 'telephone' modems on any of the TexNet nodes. You know that.

You harp on these issue because others who don't know the facts might listen to you and that it isn't about what is good for amateur radio, but all about personal attacks against a few that you believe did you wrong at some point in the distant past.

I sure wish you would get your facts straight.

The networking technology that TAPR is currently working on doesn't utilize 'telephone' modems. It is all RF based. Radios talking to other radios. We aren't building telephone modems into any of our projects. No sir Huey.

Like the Spread Spectrum Radio Projects
http://www.tapr.org/tapr/html/taprfhss.html

or like some of the future 56K-3Mbps stuff that is in the pipeline.

or the PIC-Encoder project
http://www.tapr.org/tapr/html/pice.html

All RF based stuff.

But then again, when did you ever really worry about what is right over what sounds good to those that don't know what the real history or facts are.

Cheers - Greg Jones, WD5IVD

1490. Homemade transistors

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-04 00:00:00 UTC
From: electronstream@webtv.net
Message-ID: <25178-36B9F0B2-62@newsd-241.iap.bryant.webtv.net>
Source record: 73911

Having constructed several homebrew receivers with discreet parts and ic's, I think it would be very interesting to build one with homebrew amplifying devices. I thought a triode would be the simplest to try , even if it worked only for a short time. But im not a glass blower, so thinking the next most feasible device would be a point contact transistor, I took apart some germanium diodes (1N34) and tried to get some amplification. I fooled around placing the two cat-whiskers very close together on a single piece of germanium while using the germanium as base. Using a volt ohm meter for my test instrument (I dont own a scope) , I couldnt seem to get any amplifying effect. Even tried changing polarities and cat-whisker pressure.
Now from what Ive read, the newer point contact transistors seem to have been fused together , creating holes or electrons. But I dont think the first ones were.
I would like to know if any one out there has experience with this , any other amplifying device useful at rf,or any suggestions. Thanks.
Doug N0WVA

As several others have told you, it's solder mask. Though some are put on with printing processes (screened, etc.), there's also photo solder mask. Wish I knew where I could get some! But supplies like this aren't very commonly available to the hobby market. I'd like to find a source of liquid photoresist appropriate for etching boards, but the supplier I used to use "dried up." I used to get it for about $200 per quart (back when I was using over a quart a year making photoengraved equipement front panels). Now the same stuff is available from a different supplier for $1000/5 liters: a similar per-ml price, very little inflation in 15 years, but dang, 5 liters is a 5-lifetime supply for me these days, and $1000 is a bit steep for my tastes.

Cheers,
Tom

1496. 2Meter Antenna Question

Driving more current through the LED will not significantly change the
output.
I suggest using a LED that has the desired intensity level.
Look for an Iv Typ(mcd) rating of greater than 1000. Most LEDs have ratings
of less than 100.
The high intensity ones have ratings 1000 - 6000. See www.digikey.com
catalog number L12005
(you can search their site for this number). Radio Shack also carries
higher rated LEDs. I would give
you the number but their web site does have anything on it but their monthly
flyer.
Kelly

The 100BaseT that HP came up with that runs over cat3 wire uses all four
pairs, but _no_one_ uses this, everyone uses the 100BaseTX I believe
it's called, which is just the same two pairs as 10BaseT.

Give you an opportunity if you need some of this equipment before putting on auction. Parting out (painfully) a Nice Collins 32V2 tx. Just not enuf time to finish it.

1- 32V2 cabinet fresh re-powder coated (black), looks like new......$200. obo

1- 32V2 panel match with cab & freshly silk screened..$100. obo

Have a number of reproduced clear slide rule dials for 32V
$10. ea

The chassis I will part out & it is real clean, transformers, sub assemblies, all. Might do some trading. Want NOS certain tx & audio tubes. All the above + shipping. Terms: I prefer MC/Visa or MO.

Bunch of groups snipped. What you have is a battery pack designed for
use with NiCad cells- 10x1.2 volts. Radio Shack used to have a simple
aluminum form that would replace same that was used in several of
their CB walkie talkies. The idea of the dowel and the thumbtack
should work nicely.

I received a RadioShack DX-398 for Christmas, and am new to shortwaves. I live in an apartment and I'm guessing that the reception could be better. I went to the Shack and they suggested either their standard external antenna that you can tack to your wall or whatever, or better yet, they said I should get their battery-operated antenna so that I can just about pick up transmissions from the Voyager. I have had some bad experiences with the Shack guys not knowing what they were talking about in the past, so I'd like to run this by you experts first.

Would you go with either of the Shack antennas for this model, or would you recommend an after-market unit? Should I expect a large improvement in reception with a different antenna? Sorry if this is a standard question. Please direct me to a web page if you have heard this one too often.

Thanks,
Kevin

Doug: FB OM! Now there's an intrepid homebrewer! I think you should
check out a recent book entitled "Crystal Fire" by Riordan and
Hoddeson. They go into a lot of detail on how the first point contact
devices were made. (It is not a "how to" book - you'll proably need
more info.)
I've been interested in the theory behind the operation of the
point contact devices. I'm not sure if it was ever really
definitively explained. They moved on to the junction devices and the
point contact things sort of got left in the dust.
You should take some encouragement from the fact that many hams
have homebrewed their own point contact solid state rectiifiers...
with galena and cat's whisker! Also, when you get the rig running,
you'll be able to ridicule all the other "homebrewers" who are using
"store bought" transistors. Appliance Operators!
Please let us know how this works out.

I use a slinky antenna which is extremely cheap (and pretty easy too) to build and it gives very good results. Much better than the whip. The past couple of days I've been experimenting with 2 slinkys connected together and a cut off stereo plug. For a basic set up:

Get a metal sliny at Walmart for instance ($1.89 I believe). Connect (solder) 20 to 25 ft of wire to one end of the slinky. Then solder the other side of the wire to a 1/4" mono plug. Stretch out the slinky vertically with the wire at the bottom end. Put the slinky up outside for best performance (I have mine on the porch). The wire shouldn't be too thin. I noticed a remarkable performance decrease when I used very thin speaker wire. I think I use #20 wire now.

Thanks to the orgininal poster of this slinky antenna.

Don't be afraid to ask questions. There's not such thing as a question asked too many times. :)

1512. HELP: Trying to turn my home into a brewery.

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-05 00:00:00 UTC
From: heath_filtered@s2i2.com
Message-ID: <36bafd07.48870191@news.ncal.verio.com>
Source record: 73835

A few years ago a friend asked me if I wanted to take a class for the Ham Radio Technician License. My first question was, "What is a Ham?" My second question was, "Why?" So he told me what a ham was and my reasons for being a ham have been changing ever since.

I am really interested in learning more about electronics but I have very little foundation for it. Until I became a ham I didn't know the difference between a resistor, a capacitor, and a diode. I think I did know that an IC was that little black thing with the silver legs. :-)

I am past that stage a bit but still learning. I have built a few little items and enjoy doing these projects.

What is a good source for projects for someone at my level of knowlege?

Is there an "Electronics for Dummies" handbook or other good source of information that I should have in my library?

Just looking for a few suggestions... Thanks.

I am building the trickle charger from the article in QST, December 1997, pp.36. I got stuck because I didn't know what voltage rating to use for the two .1uF capacitors located on either side (in circuit) of the Q1 regulator. Based on the other capacitors, I figured it would be at least 16V but no more than 25V.

All I could find was 50V capacitors. My understanding is that a higher voltage rating is okay. Is that true?

Hello All

Thumbing through the January 99 Scientific American Magazine, I
was interested in the article "Taking the Earth's Magnetic Pulse" by
Shawn Carlson. In it he describes a rather novel idea for measuring
small changes in the Earth's magnetic field by making use of a laser
pointer (the sort of tool used in lectures for highlighting screens) and
reflection of the light off a modified torsion balalnce. It could be
quite a useful instrument for all VHF buffs for checking out Aurorae
etc. In the future I might have a go at this arrangement as I have a few
old "Mirror-spot" galvonometers that could be modified.

For more details about the project the article suggests consulting Roger
Baker's Web site:

http://www.eden.com/~rcbaker

Or the Web forum hosted by the Society for Amateur Scientists at :

A good starting place would be to make it 1 wavelength in circumference.

In other words, about 19 feet.

When located away from the ground the impedance of this will be about 100 ohms. Bend the cable into a circle, connect the inner and outer conductors together, and connect your feed line across the gap. Best performance will require a balun. SWR will be about 1.3 to 1.

I don't think you will have any luck with this. Diodes are single junction devices (NP). Bipolar transistors have two junctions (NPN or PNP). N stands for excess electrons and P stands for excess 'holes' (or a lack of electrons.

Don't give up hope.

I have read that there were, at the time--back before WW2, reports of some people who had 'amplifying diodes'.

What you should do is get yourself a small chunk of natural Germanium and repeat your experiment. Other minerals may also work.

Don't expect much performance, however.

If this was me, I would learn simple glass blowing and vacuum pump operation, and start out by modifying light bulbs.

You could also build an 'external anode' tube, with a metal tube for the outside which is also the anode. That way any non metalic vacuumm proof plug could be used to seal the ends. Have you considered having the tube(s) permantely connected to the vacuum pump? That way you would not have to keep a perfect seal on them...just turn the pump on for a while before applying filament.

Kraus' Antennas
Radio Engineer's Handbook
RSGB VHF and Microwave Handbook
Antenna Engineers Handbook

Check at a well stocked Library or book store near a University.

As for materials, copper or brass sheet can be used. You can even use
copper printed circuit board material (double sided type). Aluminum could
be used but it can not be soldered.

1525. Any ideas: use for 8.192 MHz TCXO?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-05 00:00:00 UTC
From: nicholas charles caruso <caruson@certco.com>
Message-ID: <36BB39FC.13126776@certco.com>
Source record: 73848

I've got a bunch (5, actually) of surplus vectron TCXO's that run at 8.192 MHz. The cans have a screw-covered port which allows access to a trimmer screw inside. Twaddling it didn't produce any noticeable change in frequency on my scope or 5 digit (sigh) counter, but of course I assume it's a fine tuning adjustment.

Anyone have any interesting ideas for using these? Note that the frequency is a power of two. I guess I could divide it down/mix it up and use the products to synthesize arbitrary frequencies.

I got these things cheap, on a whim at a flea market and they're really hammers looking for a nail.

Any input appreciated!

Remember that Radio Shack guys were asking "You want fries with that?"
last week. An amplified antenna is virtually useless on shortwave. What
you need is wire, as long as practical, as high as practical, and *outside*.
An antenna coupler/tuner can be useful in some situations, but a preamp
is worthless.

>Would you go with either of the Shack antennas for this model, or would you
>recommend an after-market unit? Should I expect a large improvement in
>reception with a different antenna? Sorry if this is a standard question.
>Please direct me to a web page if you have heard this one too often.

You want a wire antenna. Wire is wire, and can be bought cheaper at places
other than Radio Shack. Your local electrical supply house (or Home Depot,
Lowes, etc) is a better source. There are all sorts of designs for wire antennas.
There are end fed ones, center fed ones, phased ones, parasitic ones, etc, etc.
Get a book. The ARRL Antenna Book is one good source. Antennas have the
property of being reciprocal. That means an antenna that transmits well will
also receive well, so the designs used by amateurs (for transmitting) will also
work well for you for receiving.

Center fed antenna designs are nice becasue they require no ground connection
in order to work properly. End fed designs always need a good RF ground at the
feedpoint. That's often hard to provide properly. But the demands on a SWL
antenna aren't that stringent, the amplification in the radio can make up for a
multitude of sins. A simple end fed random wire, perhaps with an antenna
coupler/tuner, can be just fine worked against a simple ground rod or your
household cold water pipes. The 70 foot wire Radio Shack sells, used with
an L network tuner/coupler, can give good results if you get it up high and in
the clear outside. If you're stuck using an indoor antenna, your options will
be much more severely limited. Then you might want to try a tuned box loop.
Those are fairly easy to build too.

Antennas can be tempting targets for lightning. If you install an outside
antenna, take all the usual precautions to prevent conducting lightning
inside the house to your radio, or you. There's a current thread on lightning

protection going on here. Read it. It goes beyond what you'll likely need, but lightning is serious stuff, be aware of the potential hazards.

1530. FS:HF amp parts

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-05 00:00:00 UTC
From: Bob Miller <bmiller@calweb.com>
Message-ID: <36BB509D.119E032A@calweb.com>
Source record: 73853
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.boatanchors,rec.radio.swap

For Sale: Most of the Parts for a dual 4CX250 HF amplifier

4 each 4CX250FG (25.2v fils) tested pulls 100 percent (two for the amp and two spares)

2 each Eimac SK 630A sockets and Eimac 358 chimnys (From GRC-106 PA)

1 each 25.2 vac/ct fil xfmr for 4CX250FGs (new)

1 each three section 400 pf/sec load capacitor (new)

1 each Split Stator EF Johnson Plate Tuning capacitor 100 pf per section 3KV + spacing

6 each 540ufd/450 volt computer grade filter caps (tested, like new)

2 each 304 volt/600 ma CCS potted plate transformers (secondary series to voltage doubler for 1600-1700vdc
supply for easy icas KW. (Mil spec from TI Radar System)

20 each 2N5408 1KV/3 amp si diodes and turrent contact mounting assemblies (new)

6 each 25K/25 watt ww resistors for filter cap voltage distribution (new)

1 each Meter, 10 Ma basic movement, Square design like Collins S line meters only a bit larger (Honeywell)

1 each 2p/6 pos ceramic switch for metering etc. (new)

2 each 500 PF High Voltage Ceramic Door Knob caps (new)

2 each Large Amidon -2 powerderd Iron toroids for lower frequency part of tank system (new)

1 each Collins 8 uhy roller coil from 618T Power Amp (can be used for 20-10 meter portion of tank coil

1 each 6 postion tank switch, very heavy duty from BC-375

2 each VR-150 regulators for screen supply

2 each DPDT relays/ 12VDC coils for antenna T/R switching (new)

1 each 12VDC modular power supply for control relay usage

1 each DPDT relay and matching terminal screw octal socket base for primary AC control (new)

1 each Amperite Time Delay Relay for soft start sequence system (new) (with socket)

1 each 15 amp AC line filter

2 each Fuse Holders (new)

1 each Home brew plate choke (not grid dipped for hot spots)

2 each SO-239 coaxial connectors (new)

1 each 3X10X17 inch Hammond aluminum chassis and bottom cover (nib)

That's about it. Add a front panel, a blower, and a bunch of creative labor and you will have a nice amplifier. I spent a lot of time collecting the stuff, and now I don't where I will get the time to finish the project. $225 plus UPS on about 45 lbs. W/O power transformers $175 and UPS on about 20 lbs from zip 95827

Tnx for the read.

Among others, try Elektor for February 1998, which had a PIC-based
counter/Huff and Puff. There is also code floating around the web.

Microchip were the ones who started it all. Check their app notes.
The key innovation (which everybody now uses) was a sneaky way of
reading the 8 bit prescaler, so you can combine it with the 8 bit
counter in the microcontroller to make a 16 bit counter.

This fact is evident by looking at the decline of new amateur licenses
being granted. Also, the median age of hams is getting significantly
older. The ARRL figures that by doing away with the code requirements
----
>This poster made excellent comments. Before the Internet became popular I was studying feverishly for an amateur license not because I was interested in electronics but because I wanted to communicate with people from other parts of the world and US. With ICQ, MIRC, e-mail, and internet chat channels, communication by dits and dahs seems quite antiquated---now I enjoy "chatting" via my computer and don't have to wrack my brain about whether I heard a U or S. My ear is not that discriminating at my age(50+).
> Why is Amateur Radio dying? Because people such as yourself are carrying on a "holier than though" attitude towards those who don't yet know the code. Your attitude disgusts them, and they have no desire to become what you already are.

>>>AMEN!!!! BTW you code lovers, what are you doing chatting via telephone in this NG when you should be oscillating your key (BIG GRIN).

Whatever direction amateur radio takes, it's still a great service,
albeit it may become a threatened species.

1537. Amplifier Help Needed 3-500Z

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-05 00:00:00 UTC
From: Scott Gordon <kq8rp@primenet.com>
Message-ID: <36BBA694.7DF4E667@primenet.com>
Source record: 73860

Here is some background. The amp is running two 3-500Z. I just changed
out the power supply from 100v to 220v.
Let's take 40 meters into a dummy load:
I thought I may have a soft tube, but now I don't think so..
1 - Tube installed driving from the Kenwood TS-570 100 watts of power
using the auto tuner for my tuned inputs.. 1100 Watts out on 40 m
I can put the other tube in and replace this one and get the same
thing. I key down and talked for 20 min in the dummy load on each tube
and they hung in there at 1100 watts. I have since tried each tube
seperatley in both sockets. Same thing 1100 Watts.
If I put two tubes in there retune the the auto tuner and the amp, I get

nearly 1500 Watts out. But this never last very long. It keeps falling

back to 1000 to 1100 watts with two tubes.
Now I understand I am really driving that one tube with 100 watts less
some percent of loss via the auto tuner. And when I put two tubes in
there impedence changes and now I am only driving each tube half the 100

watts or so.
So straighten me out? Why am I seeing 1400 to 1500 at the beginning and

then it falls back with two tubes? But with one tube it stays pretty
constant at 1100?
Any info would be appreciated,

8.192 MHz reference oscillators are neat because you can get down to 1kHz with a single IC like the 74HC4060, and when followed by a 74HC390 dual decade counter, there are additional outputs at 100 Hz and 10 Hz (plus others along the way). I've used 8.192 MHz oscillators as the reference for frequency synthesizers in my homebrew LowFER transmitters and receivers. If you can't come up with a good use for your TCXO's, quote me a price. I might be quite interested.

Yeh, to something like 200 mA or more - use a resistor! Their cheap, really!

:-)

Compared to what? Sounds pretty darn normal to me for a visible LED (IR
would be lower).

"Typical" forward voltages across LED's:

1.7/1.8/2.0/2.1 V @ 20mA depending on colour and technology. If it is 1.8V
at 20mA it virtually has to be red, though some reds are higher voltage
(GaP, GaAsP/GaP)

Hello--
I vaguely recall reading an article in an ancient issue of QST(?)
re: someone who built a point-contact transistor using a galena slug
and two cat's whiskers.

Perhaps someone who has a QST index could locate the reference?
73,
Brad AA1IP

Popular Electronics is still around on the news stands. QST also carries projects as well.

As far as increasing knowledge, would suggest starting with something like "Basic Mathematics for Electronics" by Cooke & Adams (this one gives some real world examples) or another tech school type text. Once you understand the math behind the smoke and mirrors, you can pretty much figure out anything. Then the more advanced stuff you run across will sink in better.

Can you supply any more data such as plate voltage, plate current, grid drive etc.? Are the 3-500Z's matched pairs? Is the layout of the power circuit the same physically for each tube? Can you find a way to measure the plate current for each tube separately when the power starts to fall off?

Thanks very much to everyone for the leads and tips on
the dummy AA battery request. I did check with our
local Radio Shack, and the crazy dummy AA batteries are
$3.99 each in their replacement parts list. I may try
the wooden or aluminum dowel method too. Much cheaper
than the pre-made RS part! Thanks again! Steve
KC6IJM.

Source record: 73577

Hi,
Anyone know the going rate for the bud boxes (I think that was
the name brand) that matched the Collins S-line and KWM2 line
of equipment.

Apparently, they made these cabinets to match the station look of
the vintage Collins gear. Trying to figure what the going rate is
today for these boxes (The big transmitter/receiver size ones, not
the little speaker/station console ones).

Many thanks,
Joe

1587. Pinout of an SBL-1

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-07 00:00:00 UTC
From: pnarozny@c2i.NET
Message-ID: <36BD3620.65D9BF0F@c2i.net>
Source record: 73752

Hi There.
I have sevral (35) of MCLSRA-1H this stuff is very like SBL-1 as is
maybe most used.
My question is: What is the pin out on a SBL-1? This is a nice little
fellow of a
balanced mixer witch could be used to a DC. I need to know the correct
pinout. When
looking at the "pin side", i have one pin with blue around and the rest
is green. I
guess then that the "blue" pin is one (1).

Is the pinout like this?
1234
8765

Or like this?
1357
2468

Most of the circuit i have seen use "pair" of pin for out, in, and
loc.osc.

1589. Re: Antenna question: DX-398

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-07 00:00:00 UTC
From: "Sean Mc." <nospam@nul.nul>
Message-ID: <79jjon$1r3i$1@news.gate.net>
Source record: 73754
Cross-posted to: rec.radio.amateur.antenna,rec.radio.shortwave,rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew

I too have a RS DX-398 as well and live in a steel & poured concrete condominium building as well. I too am not fond of the knowledge (mainly lack thereof) of the local RS staff. I first tried RS' reel-up external antenna and it worked quite well when I strung it across the top of my windows. I am currently using a metal Slinky (yes, the toy that goes down stairs, chairs etc) and an alligator-clip to 1/8" plug wire. The plug wire can be bought at your local RS store (can be assembled & soldered much cheaper, but the RS deal is always there if you're travelling and forget or break your wire) and the Slinky can be bought at probably any department or toy store. I've only been using the Slinky for a few weeks and currently have it hanging vertically from the top of my window. It certainly looks a lot better than the stringy reel-up antenna wire and it works considerably better. I haven't tried it horizontally yet, but will probably do that later on this week. The only tips I can give with the slinky is to *make sure* that it's not touching the metal window frame or any other metal. I originally had it hanging by two paper clips but was getting some really strange (heavy overload on FM, weaker signals on MW/SW) results until I isolated the Slinky from the paper clips with scotch tape. Good luck & happy hunting... so far the Slinky has netted me quite a few more signals compared to the built-in antenna and better results than the reel-up antenna as well. On the FM band, I'm consistently & clearly picking up radio stations that are at least 250 miles away from me. On SW & MW, I've been picking up quite a few things from the Pacific Rim & Australlia and I'm in Florida.

The trimmer probably has only a few parts per million tuning range.
You'll need a better counter to see any effect.

Dave

The meter's dial is turned and the frequency swept through the region of interest while you watch the meter dial for a dip (or peak) caused by absorption. I turn the sensitivity of the meter up and sweep back & forth. I prefer to use inductive coupling if possible. Otherwise a small value cap can be used with a wire to couple the circuits.

If your not carefull, you can create unintentional tuned circuits this way. Your very act of measuring tuning will affect the circuit your testing. A frequency counter is nice to have nearby so you can monitor the exact frequency.

I got mine at HRO, I don't know about Canada, or the accessories you mention, but it does come with a belt clip, antenna, (ant. extender), schematics, and a wall wart to charge the Li batt. which plugs in to the base of the radio.

The battery seems to last forever, I haven't had to charge it after the initial charge. The case is rugged metal, the keys are tiny, and the manual and unit are very complicated.

Even without the optional barometric pressure unit, you can have the unit display the temp when powered off.

I found that the pin-out information is incorrect at
http://qrp.pops.net/qrp/scheme.htm the say the IF pins are 5,6 which are in
fact case ground.
The correct pin-out is:
PIN8=LO
PIN1=RF
PIN3,4=IF
The rest=case ground.

>completed
>his 12-digit counter ;-)

I wouldn't trust any surplus TCXO to be adjusted correctly when I bought
it, so you need to check it anyway.

My favourite frequency reference at the moment is a GPS receiver with
a 1 PPS output. The pulses have about 1 us of jitter (according to
someone else's measurements), so if you use a 10 second gate time to
measure the time for 10 pulses, you have a period that's 10 seconds
plus or minus 2 us - 0.2 PPM. Read this period with a ratio-type
frequency counter, and the average number displayed tells you the
timebase error in the counter. This is enough to give 7 correct
digits from an 8-digit counter.

For better accuracy, you can phase-lock a VCTCXO to the GPS signal,
with a low-pass filter that gets rid of the jitter in the GPS 1 PPS
signal. That should be good enough for a few more accurate digits
out of your counter. Maybe not 12 digits, but close.

Dave

1599. HELP:RF Power Combiners

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-07 00:00:00 UTC
From: John Fleenor <kf5tb@fastlane.net>
Message-ID: <AAA699F6C6830456.6A254EEE40567A1F.37F35EEEF17CF931@library-proxy.airnews.net>

The guy must be a bit screwy. Why would a person who needs to sell
something not post it to multiple groups (how else could you get as much
coverage as possible and hopefully get it sold)?
Terry

One thing to watch is for overcoupling which can cause a gross error. I think that is what Scott is reffering to . Once you find a dip, reduce the coupling by moving your dipmeter farther and farther away, till you have only a very tiny, but still readable dip. This should give you a more accurate reading.

Don

So the dip coil is just sort of waved in proximity to the reactive
components (inductive only I assume) and the frequency of the dip
oscillator is adjusted for a dip (resonance) in the meter?

Who makes a decent dipper these days? I know the Heath grid dip meter
used to be a popular unit.

I hold it still while tuning, I don't wave it. Inductive proximity
means both grid dip & circuit under test be in the same plane for
maximum magnetic coupling. But you can use capacitive probes for
E-field coupling too. But this will certainly cause de-tuning whenever
you move the meter, yourself, et.

>Who makes a decent dipper these days? I know the Heath grid dip meter
>used to be a popular unit.

Checkout http://www.mfjenterprises.com

But if you can wait a year, I may build one that covers .1 Hz - 3 GHz
with a frequency counter & computer interface.

1604. Re: Pinout of an SBL-1

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-07 00:00:00 UTC
From: geo@lnot.com
Message-ID: <XHnv2.6336$rO1.5923339@newsgate.direct.ca>
Source record: 73769

I emailed jenna tashley and told her that indeed
the pinouts for the SBL-1 on the QRP HomeBuilder page
were incorrect. She emailed me back and said this is now fixed and was very
sorry about the error and that after checking into the matter she had
inadvertantly copied one of Todd's home made mixers which had a different
pin-out.

Thanks Rod for the heads up!

http://qrp.pops.net/qrp/scheme.htm now correct

geo

1605. FS/F-Klystrons, RF transistors, trimmer capacitors and lots more

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-07 00:00:00 UTC
From: bw201@torfree.net
Message-ID: <F6t0Bx.JJI.0.queen@torfree.net>
Source record: 73770
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.swap,sci.electronics.components,misc.industry.electronics.marketplace

Here is an updated list as of February 3 as some items were sold.

The following are personal items I have for sale. Best reasonable
offers accepted, but I reserve the right to deem what is reasonable ;-)

I will not consider offers totalling under $20 (before shipping) due
to the amount of bother in breaking up all of this into very tiny orders,
but will break this up into smaller orders, so you may bid for all or
some of the quantity of a particular item and mix and match as you wish.
Final discretion is completely up to me, and I will not even respond to
absurd bids (such as the guy who wanted all 72 triacs for $10 Canadian
including shipping when the shipping would have been about $6!) The
minimum reserve bids are primarily for the cheapest priced items to keep
away the people who think I will sell the whole lot for almost nothing,
but also for the rest of you so you know I am not completely heartless.

I will have other stuff to add to this list over time as I go through
my drawers and a couple of boxes. I hope this will go well and that
I won't have to resort to E-Bay at some time in the future. So I will
post the updated list as items are sold. But I don't expect it to
sell quickly because of the nature of the items. I have to see if
this will work well or if it will be total anarchy.

E-mail your offers to bw201@torfree.net

Shipping is extra, but I can confirm shipping from Toronto, Canada and
can work it into the price if you wish. You may make bids in either
Canadian money or U.S. dollars. Orders must be prepaid but I can send
you references of people I have dealt with on sci.electronics.* groups
all of whom were happy with our dealings. And once an offer is accepted
we will trade physical addresses and phone numbers.

I have done all of my shipping by surface or air, parcel post, insured
by the post office so far with no problems.

Thanks

Qty. Item MINIMUM reserved bid
All items have never been for the TOTAL
been used unless noted quantity of this
(ie. it says "USED") particular item in

8 NE5533AN Dual very-low noise Op Amp designed for 8
high quality low level audio preamplifiers

10 Solitron Devices, SD10, Sounvister - NOISE ZENER's 20
9V Zener diodes used as audio white noise sources in
much audio equipment. Comes with data sheet showing
individually tested noise outputs of 390 to
900 uV/20Khz @ 600 ohm, ordered by International
Rectifier (according to the data sheet) in 1975

1 Sigma Datacel # 301R2-24 optocoupler
with one lamp and two photoconductive cells

6 Clairex Photomod # CLM4012 optocoupler with one lamp
and one photoconductive cell with spec. sheets

1 Amphenol # 335-10871-3 SPDT coaxial relay 26VDC coil
silver plated with 3 miniature coax female (SMA?)
connectors, Date code 6836, but never used

35 DG180BP Dual SPST Very Low-Resistance (�10) J-FET 100
Low Distortion Analog Switches especially suited to
Video or Audio Switching purposes and precision Sample
and Holds, by Harris/Siliconix/Intersil list price
$20.20 U.S.! I have copies of the specs sheets for
you plus a summary of the data is at the end of this list
(FET switches unlike CMOS ones do not change resistance
with signal and so are extremely low distortion)

5 2N6347A Triac 12 Amp 400 volt by Motorola 2.00
non-isolated TO-220

3 MAC10-8 Triac 10 Amp 600 Volt by Motorola 0.75
non-isolated plastic case

31 Q4004L4 Triac 4 Amp 400 Volt by Teccor in 7.50
Isolated TO-220 plastic case

6 Q2040PFC Triac 40 Amp 200 volt by Teccor in 9.00
Isolated flange case

15 SC250B2 Triac 15 Amp 200 volt by G.E. Isolated Stud 12.00
package with locking nuts for mounting

12 TIC226B Triac 8 Amp 200 volts by T.I. in 3.00
non-Isolated TO-220

8 medium sized 0.5"/13mm dia, 120 VAC use MOVistors, 2.40
Panasonic (Matsushita) # ERZ-C10DK241, and

8 small 0.35"/8mm dia # ERZ-C05DK241 MOVistors by 1.60
Panasonic for 120 VAC use

3 Raytheon 726C/JAN Kylstrons used and in unknown
conditions but tube filaments are good (Listed at

$115 each brand new at www.elexs.com/10Klyst.htm)

5 2N5947 Low-noise low-distortion TO-117 stud RF NPN
transistor by Motorola for CATV and broadband amplifiers
5 Watt Pd, 400mA Ic max., 30 Vceo, 1100 MHz minimum fT
at 75mA Ic can provide photocopy of the data sheets

50 2SC1254 Low-noise UHF-VHF NPN transistor TO-72 case
by NEC. 800 MHz minimum fT at 6mA, 50mA Ic max.
25 Vceo, 0.25 Watt

5 80180 TO-117 stud RF NPN transistor by MEC for CATV
amplfiers. 5 Watt Pd max., 250mA Ic max., 25 Vceo,
1500 MHz fT

2 MPS6507 UHF-VHF NPN transistor TO-92 by Motorola 0.50
700 MHz minimum fT at 10mA, 100mA Ic max., 20 Vceo

1 MPS6511 UHF-VHF NPN transistor TO-92 by Motorola 0.25
1200 MHz minimum fT at 10mA, 100mA Ic max, 20 Vceo

4 MPS6547 UHF-VHF NPN transistor TO-92 by Motorola 1.00
600 MHz minimum fT at 2mA, 50mA Ic max., 25 Vceo

2 Isolated tab dual NPN RF transistors in special package
probably made by MA/COM. Looks like they are dual
common emitter RF Power transistors for CATV driver
broadband amplifier applications. I have no specs
but believe the part number start with "PH" as is a
common series by MA/COM. One says:
"N640 -12 and the other "W640 -12
PH2306 349" PH24010 313"
Rectangular tab with one mounting hole at each end,
and 7 .05" wide ribbon leads (3 on one side, 4 on other)

2 SHORTED General Electric C50 110 Amp SCR's free with
Electrically they are useless, but you might minimum $20
be able to use the braid on them. They are purchase
also great to hold by the braid and then whip but you pay
a mugger over the head with! ;-) the shipping

2 Used Piezoelectric Ceramic Blocks with metalized
ends. About 2" x 2" x 1 1/8". HEAVY

2 Mica compression trimmer capacitor 20 - 150pf
2 lug connections with a separate grounded screw
adjustment grounded through a centered mounting
bracket - flat base style approx. 7/16" x 7/8

79 Mica compression trimmer capacitor 35 - 250pf
2 lug connections with a separate grounded screw
adjustment grounded through a centered mounting
bracket - flat base style approx 5/16" x 13/16"
part number 310720850061

57 Dual mica compression trimmer capacitor PCB mount
with capacitors set in ceramic block 1 1/16" x 1 3/16"
with maximum height of ceramic 7/16" high.
Includes some silvered mica plates to limit range.
One capacitor is, 390 - 470pf,
the other capacitor is two sections in series:
first one 230 - 375pf, second 140pf fixed
Electro Motive part number 51102200
For you homebrewers, by removing the extra flat
plates and silvered mica sections to create various
combinations eg. 10 - 80pf with two plates one mica,
and 20 - 120pf with three plates and two mica pieces
or 10 - 75pf with just the top two plates and one
mica piece.

100 SFE10.7MA5A Murata-Erie 10.7MHz ceramic IF filter
(red dot - 10.70MHz center frequency) 3dB bandwidth
280 ±50 kHz, 20dB bandwidth of 650kHz, 6dB insertion
loss, 330 Ohm input/output impedance, the standard
for most stereo's and home receivers

1200 Ferrite beads - About 0.1" long x 0.13" O.D.,

84 Taiyo Yuden 3 lead passive hybrid filters 1.00
pn BPF07225, believed to be 72.25MHz bandpass
filters for commercial band receivers.

1 Double Disk converter/hole punch All metal construction $1.00
Yes the original product in the original box for you
antique lovers! Now if you can just find 3.5" 720k disks ;-)

80 USED - Miniature lamp holders with 24/28 volt lamps 5.00
plus 16 spare bulbs

12 Appliance neon indicator lamps with internal resistor 4.00
3/8" x 1 1/4" rectangular hole

9 Appliance slide switch 3A@125VAC plus 5.00
neon indicator lamp with internal resistor
3/8" x 1 1/4" rectangular hole

48 Knobs for 1/8" shaft Raytheon pn TSA50-2WL-1 9/16" dia
x 7/16" high. Fluted black polycarbonate knob with
brass insert with one set screw, white line up the side
and brushed aluminum circle on top.

3 Alco black machined aluminum knob for 1/8" shaft with
flat finger grip and thick aluminum skirt
numbered from 0 through 9

15 Various plastic knobs with set screws for
1/8" dia. shafts

12 Knobs for 1/4" shaft. 1 1/4" dia. x 5/8" high
Fluted black ABS knob with aluminum insert with two set

screws, NO pointer, with brushed aluminum circle on top.

12 Solid aluminum knob for 1/4" shaft. Aluminum coloured.
24 sided, with round front, 7/8" dia. max x 3/4" high
total. Smaller round base of 11/16" dia. for 1/4".
One set screw. Part brushed aluminum, part polished.
Nice looking. Has 1/32" wide metal insert as pointer.

3 Various machined aluminum knobs for 1/4" shaft

4 Various plastic knobs for 1/4" shaft

10 Large plastic knobs for 1/4" shaft with one set screw
Gold-coloured anodized alumimum cap, brown plastic
approx 2" in diameter and 5/8" deep

1 Strobe - flashes from 1 to 6 times a second. 20
Good for use in medium sized darkened room like a
rec room. Approx. 4 x 6 x 12 cm. (This unit and
the one below are in Hammond 1591C Heavy Duty ABS
boxes with 1591AC clear lids. These boxes alone cost
over $7 US each.) Runs off of the
AC outlet and has internal fuse for protection.
Uses FILM capacitors (3.3 ÂF) for charge storage.
The first item that "blows" on strobes are the
Xenon flash tubes, the other major item is the
capacitor if cheap electrolytics are used rather than
film capacitors. Film capacitors also have much
lower ESR (effective series resistance} and so are
usually as bright as strobes using electrolytic
capacitors with 3 times the capacitance.
(2 Linear replacement Xenon tubes are available for
$1.50 each, but only with the purchase of the strobe.)

1 Strobe - flashes from 2.5 to 14 times a second. 35
Good for use in medium sized darkened room like a
rec room. Approx. 4 x 6 x 12 cm. plus the size of
the external fan that includes a finger protector.
(This unit built in a Hammond 1591 Heavy Duty ABS
box with 1591 AC clear lid.) Runs off of the AC
outlet and has internal fuse for protection.
Uses Film capacitor (3.3 ÂF) for charge storage.
Because it uses the same capacitance as the $20
unit, but flashes up to 2.5 times as often, it
delivers up to 2.5 times as much power to the
Flash Tube. Includes a built-in fan to increase
Xenon tube life as well as using a special tube
designed for higher speed/higher power flashing use.
(4 Linear replacement Xenon tubes with data sheet,
are available for $4 EACH, but only with the
purchase of the strobe.)

WARNING: prolonged exposure to higher flash rates
can produce nausea and even epileptic-like seizures
in some people who are NOT epileptic.

1 6 Digit mechanical counter with 6 Digit preset 1
which drives relay - 93 Volts DC
could probably be powered by one of the
16VAC + 50 VAC listed below

1 ACE cylindrical key mechanical 7 pin lock 1
with 3 keys, for cabinet etc.,

16 25k Linear 50mm-travel slide potentiometer 2
with centre detent - no 3mm mounting screws

Military Grade high-G shock resistant relays

1 USED Hi-G Inc. 26.5VDC 575 DPDT 2A contacts
20 x 10 x 10mm

1 Branson #AR6919 26.5VDC 390 4PDT bolt-mount
20 x 23 x 10mm

1 HiG Inc. 26.5VDC 675 DPDT 2A contacts
20 x 23 x 10mm

1 Struthers-Dunn 26.5VDC 300 DPDT 5A contacts
25 x 31 x 15mm

4 Deutsch Inc. microsized 25.5VDC 1.3k DPDT
only 10 x 15 x 5mm!

(Solenoids and transformers are preferably for sale in the Toronto,
Canada area for pick-up, because of the cost of shipping heavy items
such as these, but if you are willing to pay for the shipping I will
send these anywhere.)

SOLENOIDS (very heavy but if you are willing to pay the shipping
you are welcome to them with minimum $20 order)

7 Unmarked solenoids 110VDC - 1" x 1 1/4" x 2" free

10 Unmarked solenoids 110VDC - 1" x 1 1/4" x 1 1/4" free

TRANSFORMERS (all with 115VAC primaries except the audio xformers):

1 Used "Type 10B" Variac "Powerstat" variable
transformer by the Superior Electric Company
120 VAC in, 0 to 120 or 0 to 132 VAC out @ 2.25 Amp
plus one 3 Amp resettable thermal circuit breaker

5 Microtran T1104, telephone coupling transformers
600 : 600 Ohm, 300-3500Hz 0.5dB, 0.5% distortion max
3/4" x 7/16" x 9/32"

3 #154A5969-1 Green audio transformer
1" x 3/4" x 7/8" believed to be 700mW
250 Ohm resistance and 30 Ohm resistance, believed
to be 5k Ohms to 500 Ohm Center-tapped impedance

1 Calectro D1-726 audio 3/4" x 5/16" x 5/16"
500 Ohm C.T. to 8/3.2 with 2" long insulated wires

1 Red audio transformer 1" x 3/4" x 3/4" three windings
26 ohms, 26 ohms and 50 ohms resistance,
believed to be 1k, 500 and 500 ohm impedance

2 Blue audio transformrs 1" x 3/4" x 3/4" three windings
52 ohms, 82 ohms and 82 ohms resistance,
believed to be 1k, 2.5k and 2.5k ohms impedance

1 Yellow audio transformer 1" x 3/4" x 7/8", one winding
26 Ohms, the other is 82 ohms resistance with two taps,
believed to be 500 ohm to 5 kohm (w/taps) impedance

1 Hammond #167J36 36VCT @ 1A closed frame
Heavy metal protective cover over windings

2 Hammond #166G36 36VCT @ 0.5A open frame

2 Signal Transformer ST-3-36 36VCT @ 65mA P.C. mount

2 Used 10VA 40VCT shielded

1 Used Hammond #166G20 20VCT@0.5A open frame

1 Hammond #166L5 5VAC@2A open frame

7 16VCT and 50VAC ±6VA

1 10 VAC + 10 VAC; 6 VA pcb mount transformer
by Signal Transformer; Split Trans # DST-40-20

6 11 VAC ±3VA (ie. ±250ma)

1 9.5 VAC @ 200mA

1 25VAC ±3VA

3 12.6VAC ±3VA

2 30 VAC @ 50mA

1 12VCT @ 150mA

1 Used 34VCT @ 20VA - 120/240 VAC input

3 AC adapters 7.5VDC @ 300mA 3.5mm plug

2 AC adapters 4.5VDC @ 100mA coaxial power plug

2 AC adapter 16.6VAC @ 100mA no connector "Atari"

1 AC adapter 9VDC @ 100mA coaxial plug

1 AC adapter 6VDC @ 300mA no plug

MOTORS (cheap! No bid too low on the unreserved motors as long as your total order meets the $20 minimum before shipping is added.)

1 "MN-30 Micro Motor" by Tradeship (California) Inc
Open-framed 12 Volt DC 5 pole permanent magent hobby
motor at up to 18,000 r.p.m. 3/32" shaft with gear
about 2 1/4" long with mounts, 1/2" thick, 3/4" wide
graphice brushes. In original box

1 "MX-77 Micro Motor" by Tradeship (California) Inc
Open-framed 12 Volts DC 7 pole permanent magnet hobby
motor at up to 20,000 r.p.m. 3/32" shaft with gear
about 2 5/8" long with gear, 5/8" thick, 7/8" wide
graphite brushes. In orginal box

1 Sychron 20 r.p.m 24VAC 6Watt AC motor

6 3-12 VDC permanent magnet motors
body approx. 1" dia. X 1.5" long with 1/2" long
shaft. Has graphite brushes

4 1.5-6 VDC permanent magnet hobby motors
body 0.5" x 0.8" x 0.9" long with 0.15" long shaft

16 Misc. USED motors with assorted voltages from 1.5
to 12 VDC, including motors used in cassette tape
recorders and VCR's.

4 108 VDC permanent magnet motors 7500 r.p.m.
full-load current of 0.08 amps. Rated for 105°C @
20 minutes. Body approx. 1" dia. X 1 3/8" long
with 3/16" long "d" shaft

3 USED pancake type 12 Volt stepper motors
removed from old floppy drives

1 USED cube style stepper motor from an old Hard Drive
body approx. 1.5" X 1.5" X 1" with gear on shaft
short 3/4" long leads

1 New stepper motor Rapid-syn model 20V-03L 6
Impedance protected. 6 leads. I can't "feel"
the step size. 2" dia. x 2 1/2" long body.
Double shafted 1/4" dia. x 1" long at both ends
Three threaded mounting holes at one end -
two at the other

1 Used stepper motor similar to above 20Volt 3
somewhat longer shafts. 6 leads with connector
Rapid-syn model 20V-01J. Looks like one end is
meant to fit into a 1.75" dia. hole, with a ridge
presumably for holding it in just above this.
"Feels" like it is 3.6° step size.

1 Stepper motor used from HD. 5 lead with connector
Astrosyn model # 17PS-c006-01. 1 5/8" x 1 5/8" x
1 1/4" body. 5mm dia. x 12mm long shaft.

Misc:

2 5 cm dia. 100° 0.2W

DG180 DATA:

DG180BP Dual SPST Very Low-Resistance (10) J-FET Low Distortion
Analog Switches especially suited to Video Switching purposes
and precision Sample and Holds, by Harris/Siliconix/Intersil
They listed at $28.25 each (CND funds) at the time I purchased them.
I have full spec sheets and Siliconix price list that shows them at
$20.20 U.S funds in singles, $13.44 if bought in 100's quantities.

I was doing a video switching project with a friend some time ago and
chose the DG180 JFET switch because it had the lowest resistance of any
I.C. and because of its very low distortion, since JFET switches unlike
CMOS ones retain constant ON-resistance for varying analog inputs.
These 35 are what I had left over.

I will of course provide data sheets with the chips.

Here is the basic data on them.

DG180 by Silconix (and second sourced by Harris/Intersil)
Dual SPST JFET Analog Switches

Features:
* Constant ON-Resistance Over Entire Analog Range (UNLIKE CMOS DEVICES)
* Low Leakage
* Low Crosstalk
* The lowest ON-Resistance available in any IC

Benefits:
* Low Distortion
* Eliminates Large Signal Errors
* High Bandwidth Capability

Applications:
* Video Switching
* Audio Switching
* Sample and Hold
* D/A Ladder Switches

The DG180 is a precision dual single-pole, single throw (SPST) analog
switch designed to provide accurate switching of video and audio signals.
This switch is ideally suited for applications requiring a constant
ON-resistance over the entire analog range.

Reduced switching errors are achieved through low leakage current
(Isoff < 1 nA). Application which benefit from flat ON-resistance
include video switching, audio switching, and precision sample and holds.

Each device comprises four n-channel JFET transistors (in parallel) and a
bipolar driver (TTL compatible) to achieve fast and accurate switch
performance. In the ON state, each switch conducts current equally well
in either direction. In the OFF condition, the switches will block up to
20 V peak-to-peak, with feedthrough less than -60dB at 10 MHz.

For the DG180BP (14 Pin Ceramic Side Brazed Package) by Siliconix:
(Part number DG180BK for the Intersil/Harris Ceramic DIP package)

Operating temperature range = - 25 °C to 85 °C

With V+= +15 V, V-= -15 V, and VL= +5 V:

Analog Signal Range Full temp range -7.5 to + 15 Volts

Switch Resistance @ Is = 10 ma Room temp 7.5 Ω typ. 15 Ω max.
Full temp range 25 Ω max.

Switch Saturation Current 2ms Pulse Duration 300 mA

Turn On time 240 ns typ, 600 max.

Turn Off time 140 ns typ, 250 max.

OFF Isolation f = 1 MHz, RL = 75 Ω typically > 55 dB
10MHz, RL = 75 Ω typ. 35 dB
50MHz, RL = 75 Ω typ. 20 dB

Also guaranteed to work with +12 Volts, -12 V and +5 V power supplies.

End of list

1606. Re: Grid Dip Meter Question

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-07 00:00:00 UTC
From: Tony Hwang <2810311762@home.com>
Message-ID: <36BE19BD.766E5050@home.com>
Source record: 73771

Hi, Dan,
Dip meter is not a precision instrument but it is good enough in most cases. You can measure the resonant freq. on a active or passive L/C circuit. Re: your question,
You must have a ball park guessing which range your circuit under test may fall into. Accordingly plug in the right coil to cover that range. Adjust the meter to mid-scale, and then position the dip meter coil to the circuit(not too close which will lead to wrong reading) and slowly turn the tuning knob. If the ckt is active you'll see peak, if passive you'll see dip, try to loose the couling between the coil and ckt and repeat the process few times to get reading as accurate as possible. Then read the dial. Since dip meter is an oscillator, you can use it as a marker freq. or as a source of certain freq. There are so many uses for it. It becomes handy when you install antenna too.
Hope this helps. I am not good at explaining things.

Message-ID: <01be52e6$72109e40$69e21dc3@default>
Source record: 73772

Hi folks,

I'm looking for a bandswitch that could easily switch PI filter coil in my new HF
power amplifier with 2 x 4-400 tubes. I expect pure 2.000 W of output power at
some 4.4 kV DC on plates (loaded). It should have 9 positions to cover all
amateur bands, including WARC.
Any help?

I'm a owner of the ICOM PCR-1000.

So everybody tells that the sensitivity is so good on the PCR-1000 !

The sensitivity at 144 to 146 Mhz is not so good as I expect !

It is measured at 12dB SINAD and at 144Mhz 0.32 ?V.
My Kenwood portable TH-22 is also measured by 12dB SINAD
and at 144mhz 0.16 ?V or less sensitiv.

So who nows haw I can improve the sensitivity of my PCR-1000 ?

All information is welcome !!!!

Thanks to all.

Message-ID: <79lng9$43u$1@nnrp1.dejanews.com>
Source record: 73586

Divide 468 by Freq in Mhz to get the overall length in feet. Connection point is in the exact middle. Although a dipole is a 75 ohm antenna, your rig is likely to be 50 ohms and either cable will give an equally slight mismatch, nothing to worry about. As for a balun, (with a 'n') if you have one you can try it. Wouldn't hurt but I doubt you'd see any difference.

Good luck-hope this helps..

In article <36d73a4e.177237476@news.atl.bellsouth.net>,
ke4zv@bellsouth.net (Gary Coffman) wrote:
> You want a wire antenna. Wire is wire, and can be bought cheaper at places
> other than Radio Shack. Your local electrical supply house (or Home Depot,
> Lowes, etc) is a better source. There are all sorts of designs for wire
antennas.

With all due respect, there are even places cheaper than Lowes and Home
Depot. find a "farm & fleet" store, the kind of place that sells tractor
parts, dog kennels, livestock tranquilizers (grin) and Carhartt coveralls.
You can usually recognize the place by the piles of feed, fertilizer, and
huge plastic tanks in the parking lot.

Anyway, go inside and ask for electric fence wire. You'll be directed to
spools containing wire by the MILE. It's galvanized steel wire, 16-18 gauge
usually, and it's WONDERFUL for antennas. The steel is much stronger than the
soft-drawn copper you'll get at Lowes, it's not insulated so it won't be
carrying extra weight, and the zinc coating solders very, very well. And it
runs (last time I checked) about $20 per spool.

I worked with a fellow at Universal Radio in Ohio who went to buy a spool, and
at the checkout they asked him if he was in the farmers' discount program. (A
discount program for farmers, as you might have guessed.) He said yes, so they
gave it to him for half price. He's still using that one spool of wire to this
day.

If you can't find a farm & fleet store, check the various discount places ($1
stores, overstock / closeout stores, or even K-mart in a pinch). You'll find
little blister packs of "utility wire," usually 50 or 100 foot rolls for a
buck or two. It's the same stuff, just more expensive per foot.

Dave

Source record: 73588

How I use my GDO:

I find it convenient to couple the grid-dip meter into the circuit and
change the tuning on the dip meter until you notice a dip.
If you move the meter away from the circuit and change the tuning
false (internal) dips can be discriminated.

Depending on output power the coupling can be loose - i.e. the GDO coil
can be held in proximity to the coil of the circuit you are testing, or it
may be enhanced by using a single or two turn link wrapped around the
GDO coil and the coil in the test circuit.

There have been several GDO circuits published in the ARRL Handbook.

1614. Source for high-Q homebrew IF filter crystals.

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-08 00:00:00 UTC
From: henryp@cartier.raleigh.ibm.com
Message-ID: <79n25smiu1@rtpnews.raleigh.ibm.com>
Source record: 73589

I have a quote from Colorado Crystal Corporation to build crystals with Q in the range of 800K to 1,000K. The center frequency specified is 5.0 MHz, but this is just representative. As the center frequency goes down, the Q goes up, and so does the price. At 10.0 MHz, the Q is in the range of 170K - 220K.

Price in quantities of 100 is about $15, subject to change when the final specs are determined. In quantities of 50, the price is $18. At this price, you can build a ten-pole CW filter of extraordinary performance, better than anything available commercially.

For various reasons, I'm designing for an IF frequency of 5.2075 MHz. Is anyone interested in going in on a bulk purchase?

Reply to 'henryp@us.ibm.com'.

Body handling: Binary attachment payload not displayed: vcard.vcf

Geert, I believe that you need to connect the horizontal and vertical feedpoints of your crossed yagis with a 90 degree phase shifter. This would be a quarter wavelength (including velocity factor) of coaxial cable. You would then connect your feedline to one of the feedpoints. I am not sure which one (horizontal or vertical) would go to the feedline for right-hand circular polarization. You need to check a good book or a more experienced VHF/UHF ham. If you connect the feedline to the "wrong" antenna, you get left hand circular polarization instead of right-hand! This all assumes that the horizontal and vertical elements are coplanar, or very close together. If they are not you would have to compensate with the phase shifter. Hope this helps!

Hello,

You have asked for 7768 valves many times before, and I have posted
this message many times. Haven't you noticed?

7768 General Electric NOS, NIB are in stock. This is a very special
valve with a transconductance of 50mA/V and u=225
I can find a few more data for you if you want it. This is a rather
expensive valve NOK 760.- each or about US$ 103.-

Best regards,

Arnold Goksoyr

Several questions:

Why 5.2075 IF ?

What are the design specs of the filter (extraordinary CW filter) ???

What design are u using for the filter ??
(there are several out there,
Ladder,
Lattice, Cascaded Lattice have seen these in alot of commericial filters I opened

)

What about the assymmetrical bandpass characteristics of a cascaded ladder filter

with so many poles.

QQQ : Why shouldnt we just convert to a IF of 15 KHZ from 455Khz ,
and just use one of the powerful DSP processors EVM to implement
whatever filter you desire.
DSP filters have better passband/stopband characteristics, and
ring much less. Plus, they can are very flexible .

I love those DSP filters in my ten-tec Rx320 !!!

1628. MFJ's new air core roller inductors

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-08 00:00:00 UTC
From: TLNixon@revealed.net
Message-ID: <36bf3d8e.67831232@news.revealed.net>
Source record: 73603

MFJ has been advertising a new concept in roller indiictors in their antenna tuners. They call them "Air core." Well most of the roller indictors I ve seen have been air core, but does anyone know how these are made? maybe a treaded brass shaft with a slifing singer of brass that glides up and down the inductor as the shaft is turned Does anyone out there know??

I've seen photos in the various magazines, and it looks like they use clear plexglass or lexan (registered trademark) . It's probably so simple I'll be stunned when I see it!!!

Thanks
Terry-WB0VQP

1629. Small load Antenna Tower Ideas needed.

The subject says most of it.... I'm looking for ideas of how to build a cheap (pvc possibly) antenna tower, possibly 20feet, must be able to break down
for transportation to other locations, and support smalll 2m antenna's, one 3el. beam, a j-pole (made from 300 ohm twin lead), and a 440 1/4wave verticle...

Please reply to waffle@oz.net by email

Greetings Noise Warriors:

Would one of you kind souls be good enough to give me a copy of the schematic diagram (& parts list) for an MFJ-1026 or MFJ-1025 RF Rx Noise canceling unit? I would like to look it over and see if I want to mimic it in home brewing my own unit. There are some old QST articles, though the write up for the MFJ makes it sound like a better design.

My Xcvr already has a separate Rx ant input and I donï¿½t need any antenna switching capability. I also intend to H.B. low noise Rx antennas to feed into something like this.

I donï¿½t think there are any moral or ethical problems in copying the design as long as I donï¿½t try to market such a thing (and I donï¿½t).

Well Joe, Hang onto your uppers... the Bud & Hammond boxes are still available, but the cost is about the same as a small country's GNP. Check out <www.E-sonic.com> or the Allied site on the web. They have the boxes listed. I just bought a bare aluminum "u-shaped" box that was 6"W-3"H-6"D and it cost me $28CDN. If the Collins look-alikes are still available, they are probably going for about $75USD.

I've just recently, cleaned up and re-stung an old Heath Cheyenne MT-1,
somewhere down the line it was modified and an additional switch was put

on the faceplate for TX. My question is, does an unmodified Cheyenne
need to be put in Standby for recieve? In other words, does the
transmitter interfere with the reciever due to the occilator running
when sitting idle in the CW mode? If not I'd like to restore it to it's
original configuration, if so I want to add a QSK circuit to it.

Anyone know? What a nifty transmitter for $30, who said HR was expensive

:)

Chris, I highly reccomend picking up a copy of the W1FB QRP Notebook, and QRP Power. Both should be available from the ARRL at arrl.org. I learned soooo much from that QRP Notebook, Doug De Maw (SK) explained things in very simple terms and made it easy to understand. I have no desire to be an RF Engineer so I really wasn't interested in the math, just wanted to understand how and why circuits were used. I got my answers from his books. . I had never done any homebrewing until a few years ago, I started with the DC reciever from that book and wow did I get bit by the bug. There are lot's of schematics for building very simple transmitters etc. Most can be built in a couple hours and most all his work is available on PC boards from FAR Circuits.

Good Luck,

Tim ka8ddz

Absolutely, a battery operated antenna and an 80ft dish will net you plenty of Voyager reception.
(sorry I just couldn't resist after reading "transmissions from the Voyager"

Kevin, you've already had your question answered but I thought I'd dump in my two cents. The key, as many have already pointed out is to get some wire OUTSIDE, for receiving just about any wire will do, it makes NO difference if its solid copper, stranded, covered with teflon or plastic, red, blue or green. If your in a situation where you can't string up a permanent antenna then consider some of these tactics:

If your high (3rd floor or higher) get some small gage wire like awg 26,24,22 and spool it up on a fly reel, I like the fly reels because they are larger and don't bend the wire so small. Put a good size sinker on the end, stick it out the window and lower it almost to the ground the using a test clip hook onto the wire. If it's coated with enamel use a razor blade and carefully scrape off the enamel and mark that spot for future reference.

If your in a complex, I'd approach the landlord (perhaps with a fine Dominican Republic Cigar) and ask if you could string a small gage wire along the roof, you can buy standoffs in many varieties and you would only need 4 or 5 of them if you do it right. If you have a railing along a long outside walkway you could stand the wire off to the outside near the base where it's not conspicuous. You can use nails and wrap the wire around each nail once or twice, just put a piece of electrical tape around it and it should provide adequate insulation.

These are not ideal antenna configurations but better than anything indoors. Be creative but get that wire outside!

Good DXing

>> -Henry, KU4XC

It may be of interest to you that quartz has an intrinsic QF product
of about 10^13 for the axis used in the AT mode. Thus the Q's you
quoted at 5 MHz are within a factor of 2 of this limit. OTOH, it is
entirely possible to do even better than this, and at 10 MHz. High
quality crystals at 10 MHz routinely top the 1,000,000 Q mark. What is
interesting is that relatively low cost crystals often have surprisingly
good Q. I would shop around and see what you can get from other vendors
at 10 MHz. You might get higher Q for less $$$. Lower frequency
crystals, to be any good, have to use a bigger piece of quartz, it goes
as the inverse cube of the frequency. Naturally, this costs more.
5 MHz is probably a good place to stop. 2.5 MHz crystals which used
to be used in frequency standards are relatively huge and tend to be
quite microphonic. If at all possible, redesign your receiver to use
a 5.000000 MHz IF, so that you can use any 5 MHz crystals that may
be around. There are a thousand of them for every one at 5.206 or
whatever that was. You might find that a vendor is already making
5 MHz crystals for someone else and can sell them to you at the
quantity price. Economy of scale, and all that. Here's a concept:
buy reject crystals with lousy aging, poor tempco, or frequency
jumps. You'll never notice that in a crystal filter.

Call for Papers
for
Central States VHF Society
Conference and Proceedings

The CSVHF Conference will be held July 22-25 in Cedar Rapids, Iowa.
Authors wishing to submit a paper
and/or make a presentation at the conference are encouraged to contact
Barry Buelow WA0RJT. Papers
will be accepted in technical areas related to VHF and UHF equipment
design, antennas and related topics.
Operating procedures and reports of band openings are also welcome.

The closing date for submitting a paper is May 15, 1999. Printed
material or electronic media will be accepted.

The CSVHF Society maintains a web page at http://www.csvhfs.org

Authors should contact:
Barry Buelow WA0RJT
4110 Emerson Ave NE
Cedar Rapids, IA 52411-6716
Email to: bjbuelow@plutonium.net

>
>If so, some of your RF is going to be wasted as heat.
>
>de Dave (G0DJA)

Yes it certainly will, about 17 times more in fact. Because
steel is ferromagnetic, the skin depth is very shallow, so
the skin resistance is a lot more than its increased DC
resistance over copper would indicate. You can also get
aluminum electric fence wire. That will have much less
loss. But it is very fragile, aluminum fatigues rapidly when
flexed, and it will quickly fail if not supported every few feet.

Copper wire has the properties we want in an antenna
wire. It isn't very expensive in the quantities we need.
So there's no good reason not to use it.

I must say that I don't understand the thinking processes
of people who think nothing of dropping over $1,000 for a
radio, but then carp about a few pennies a foot for the
antenna wire which makes the radio useful.

One question......are you really sure the problem is caused by Parasitics?

A couple questions.......is the amp designed as a grounded grid?
If so, what size bias diode or standby bias have you on the cathode?

Good luck, that tube can be a bearcat to stabilize. I've built several amps
with them.

Hi,
Anyone out there with expertise in these marine hf transceivers?
I have one which I would like to mod to use cw with. Though not listed
as an option in the operator manual, cw appears on the lcd display ..
is it possible to enable it as a mode option or modify the firmware
to do the same? Currently I am driving it via the remote socket
.. with ptt and line in lines keyed and audio applied respectively ..
but it is messy and the transceiver must surely be capable of
producing a cw tone if the control firmware is patched

Thanks forany insights

Did you know that there is a $2 tax on your phone line for E-Rate courtesy of Clinton/Gore. Did you know that there is a $5 monthly tax on ISDN lines courtesy the same pair. Did you know that there are about 100 million household phonelines in the US, but somehow all this money collected hasn't made its way down to the schools who were supposed to be wired to the internet?

Clinton is only responsible for taxing the internet.

Si8901s are still around if you want to try some, Jim. However getting the required drive voltage will be tricky....square wave drive is out of the question, have to put gates in a tuned 2m LO tank circuit. Interesting circuit design.

Fairchild FST3125 "quad bus switch" has four MOSFETs with drivers in a SOIC or smaller package. Switch time with logic drive is speced as a few nS. Works well on HF (+45 dBm intercept), am sure it'll work on 2m, too, but doubt it would work very well.

A high level diode mixer would be much more straightforward way to go.

I AM GULLIBLE. For a while there I was believing that Morse Code was
important for getting a ham license because someone told me so. I guess
this isn't true. Is someone lying to me again?????
Am I naive in thinking that the only true believers are Pro-CW hams?

> its use.
> Wake up.

As I understand it, of course I may be wrong, the Internet came into
being
c.1967, but not popularized until Clinton/Gore came along. The key word
is
popularized. Did Reagan, Carter, Bush ever mention it to us? Can't
recall.
Re taxes, Which President made this famous quote: "Read my lips, no new
taxes." Another lying Democrat, George Bush.
Poor Ronald Reagan, truly he probably "...didn't remember." I know the
real
estate dealer that tried to sell him back his own home, <G>, Funny thing
how
Oliver North, Annapolis graduate, keen mind, couldn't remember details
of the
Iran-Contra Affair...gosh, don't these national leaders take notes?!?!
How about this Democratic President: "I have a secret plan to end the
war
[Vietnam]." "I am not a crook." Wasn't called *Trickie Dick* for
nothing.
I still remember all those staunch patriotic, America is #1 Republicans
during
the Vietnam War who had a calling from Heaven to become ministers, ala
Stockman (a Reagan adviser I believe). Funny how they all had a change
of heart
when peace was declared.

<SNIP> Clinton is only responsible for taxing the internet.

I must have fallen asleep in my Civics/U.S. History class in college.
Please forgive my ignorance. I didn't know only Presidents from the
Democratic Party imposed taxes on us. I'm so dumb, next time I'll have
to
vote for Reublicans who only believe in "revenue enhancement." You know,
Ronald Reagan was right, why have national parks and forests, you've
seen
one tree, you've seen them all. You should've seen his ranch in Santa
Barbara County, California--all those plastic trees on his acreage.

1649. Re: Grid Dip Meter Question

Set the dipper meter reading for midscale. Then position the grid dip coil near the tank you are testing and tune for a dip in the grid dip meter. Reduce coupling by putting more distance between them, or making the axis of the two coils closer to ninety degrees until the dip is small, but still distinct. This is to prevent the dipper tank from "pulling" by the tank you are testing, and giving you an inaccurate freq reading. (You can tell that's happening when you get a different frequency coming in from higher frequency side of resonance than you do coming in from the lower frequency side). Then read the dipper frequency....on a receiver or a counter is gonna be better than any dial calibration if you want accuracy.

Source record: 73674

Si8901 is operable at VHF, A Siliconix application note suggests putting gates in a resonant tank circuit as the most reasonable way to develop large (10-20 volts p-p) voltage swings at essentially capacitive gates. Not your normal low-impedance stuff. I have some spare 8901s available if you want to try using those.

Fairchild FST3125, and similar "fast bus switch" chips by TI and others has four MOSFETs with drivers into SOIC. Switching times are a few nS: they are great at HF but doubt they will work at 2m very well.

Unless you're dying for a chance to do some tricky circuit design, a conventional diode mixer is more likely to give you good results right out of the box. - Bill, W7AAZ

I agree. The late Doug DeMaw is a good man to read if you are not an engineer. You can mix and match most of his circuits and "design" some pretty good gear that doesn't take a project team to align and debug and get on the air. You won't build his projects from Rat-Shack parts, but neither will you have to commission a special factory run for a component, either. The majority of his designs can be built with catalogued parts from Mouser alone. W1FB QRP Notebook is definitely my favorite "cookbook".

Hello,

It is usually a problem to reject noise (generated in computers and sodium lights) while still picking up signal, In other words, Signal to noise ratio can be a problem in high noise urban areas.

At the risk of sounding like an advertisement, I would suggest a small aperture active antenna in an window . Local Noise and signal minima and maxima occur quite a lot when you move such an antenna. Certain location will give you a minima for the local noise, while still picking up enough signals. This will give you the best SNR. Connect this active antenna through a shielded cable to the receiver.

The external longwire antenna would be an excellent choice if you had enough real estate and were located in a low noise area. This should connected with a simple (homebuilt) Balun transformer to a coax cable like RG58 or RG 6 TV cable (I tend to like the TV cable better) , preferable buried in the ground (to get rid of common mode signal and noise), to your radio.

Please look at www.naswa.org for more information

Dx 398 is a fine receiver and it begs for an external/active antenna.

Hello,

I was wondering, can two switched capacitor filters be used to produce a relative 90 degree phase shift by clocking them with a quadrature clock?

I don't think the above is possible, but could there be another way to achieve it?

Thanks, Ian

Not using two separate, independent switched capacitor filters, but if two analog mux switches could read the same capacitor bank, it would be a simple matter to set the outputs 90 degrees apart.

Hear! Hear! The best buys for stuff like this are the bags of
surplus microprocessor and colour burst crystals. I routinely
see bags of hundreds for a few dollars: grade them to pick the
good ones and you have a very cheap filter. Even the new prices
(e.g. Digi-Key) are not unattractive when you buy them in
100-up quantities.

You can always play such games with DSP. But that option has its
limitations too. The first of which is ham radio's mental block
on the subject...

Actually, the President doesn't impose taxes. Congress does.

Not only does Clinton have nothing to do with this thread but these cross posts are out of context as well.

If you are waiting for either Republicans or Democrats to save the world, you might as well jump off a cliff today. Since most people can't help but to look out for their own interests, one can only expect politics to become an arena for self-serving corruption. Those who have not taken this road as they walk amongst the devils deserve all the more praise for their strong character and firm principles.

BUT - what does this 17 times greater resistance mean in practical terms? If Copper is a tenth of an ohm, even at 17 times worse, steel would only be 1.7 ohms, and could therefore be neglected as an important loss source in a 50 Ohm antenna dipole.

I have tried to get the answer to this question before and apparently nobody knew the practical effect. I will be putting up a tower this summer and want to use the (insulated) galvanized guys as an inverted vee antenna system.

Can anybody predict the practical difference in loss resistance between the very large galvanized guy wires (surface area corresponding to 1/4 inch dia) and the much smaller copper "standard" wire of 12 gauge or so? If the guy wire surface area is 17x the copper, is it a wash? Is it frequency dependent?

Yes, it can be predicted. Unfortunately, the rigorous calculation of the RF resistivity of plated wire is complex. However, if the plating thickness is at least a few skin depths, the plated wire behaves for practical purposes like it's made only of the plating material, and the calculation is simple. If you don't know the plating thickness, you can do the calculation for each material to get an idea of the limits. For example, a galvanized wire would have an RF resistivity greater than that of zinc but less than that of steel (which is much more resistive at RF). (Actually, there are plating thicknesses for which the combined resistivity is slightly greater or less than either material, but not by much.) Equations for calculating the RF resistivity of wire can be found in a lot of sources, but probably the easiest way to see the impact on an antenna is by using one of the readily-available modeling programs. The free demo version of ELNEC, available from www.teleport.com/~w7el will easily do this. You simply model the antenna with no conductor loss, then with the DC resistivity and relative permeability of the wire or plating (although there can be a catch here; you have to know these parameters at least approximately), and compare the results. The loss is frequency dependent, because the skin depth and hence the RF resistivity is a function of frequency. For full-sized antennas with a constant wire size, the amount of loss becomes greater at lower frequencies in spite of the greater skin depth. This is because when you halve the

frequency, the antenna length doubles but the skin depth (and RF conductivity) increases only by the square root of two.

To answer your other question, if one wire has 17 times the RF resistivity of another, it has to have 17 times the surface area (not 17 times the cross-sectional area), of another wire in order to have the same RF resistivity. So its diameter has to be 17 times as great. This assumes that the skin depth is only a small fraction of the diameter, which is a good assumption at HF and above for antenna-sized wires of reasonable conductivity.

Look at the Antennex website, they have a series of projects using upvc plumbing fittings and pipe for a lattice mast, up to IIRC 20 feet or so and costing approx 10 dollars per 10" section.. I dont have the URL but it should be easy enough too find them with a search engine..

You could build an A frame mast.

20 ft would be quite easy to manage, although I am not sure about the 3 element beam. Do you mean VHF or HF?

Let me see....(mumble mumble)...you would need perhaps seven 8 ft 2x4. Pressure treated wood is more durable, but heavier. Five of them would go together like this:

I
I I
I I

Put a 1 foot overlap at each section and you will get a height of 21 ft.

The remaining 2x4s are to be used for cross pieces, two at the bottom (each side) and one at the level of each joint.

Drill holes at appropriate places and install 5/16 inch bolts. And don't forget eyebolts for the guy ropes.

Dear All,
I want some xtals for a 10.7 MHz, 455kHz double superhet. I am after
10.7MHz +- 455kHz so 11.155MHz or 10.245MHz.

Can anyone help?.

Rgds

10.240 crystals are used by numerous cordless phones etc as freq ref
standard
for PLL.

It may be possible to pull 10.240 to 10.245

Digikey sells Epson 10.240 crystals in that watch crystal package.

1670. another sad Radio Shack story...

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-09 00:00:00 UTC
From: mcalhoun@ksu.edu
Message-ID: <79prcr$5g0@fox.ksu.ksu.edu>

Thought you might like to hear another sad Radio Shack story.

I'm posting this to "homebrew" even though it arose out of a "truckbrew" in which I added to my pick-up truck a second battery with isolated charging, DVM voltage monitering, HF and VHF radios, power outlets in the "topper" area, NVIS antennas (which worked VERY WELL), etc. (the "etc." included replacing the AM/FM radio).

Between the "cut here" lines is a copy of a letter I sent last October; what happened and my conclusions follow the letter.

---------- cut here ---------- cut here ---------- cut here ----------
Leonard Roberts, President
Radio Shack, A Division
of Tandy Corporation
100 Throckmorton St, Suite 1000
Fort Worth, TX 76102

Dear Mr. Roberts:

I want to let you know just how UN-happy I am with the Optimus "In-Dash AM/FM [Radio with] Stereo Cassette with Auto-Stop" (Catalog # 12-2009) I purchased in March, 1996, and installed in my pick-up truck in April, 1997, right about the time its warranty expired (I'm just slow--my problem, not yours).

Basically, your radio has always had two problems; the first I found immediately, and the second I just discovered this past week:

1. Its selectivity on both AM and FM is TERRIBLE! For example, there is a small (5,000-watt) AM radio station whose transmitter is located on the other side of town. That station (at 580 KHz) can be clearly heard from 530 through 640 KHz and effectively precludes listening to any another stations on those "adjacent" frequencies except for one which does make it through at 610 KHz. Similarly, there is an NPR/ classical-music FM station at 89.5 MHz to which I like to listen, but stronger stations "bleed" through until that station is wiped out!

Another FM example: there is a local FM station at 103.5 MHz; I can hear it clearly at 89.1 MHz, 89.3 MHz, 90.1 MHz, and on up the dial. That is TERRIBLE selectivity.

But, because I was so slow in installing the radio such that the warranty had expired, I thought I'd just have to live with the "lemon".

2. However, just last week I used the "CD" input for the first time. It worked fine, BUT when I left the cable plugged into the radio

overnight, the radio LOST ALL of its programming: all 30 radio memories AND the clock time! With this new discovery I just have to complain.

Speaking as an electrical engineer with more than 30 years of experience, I can understand the cost/performance tradeoffs of building a not-too-expensive radio with poor selectivity, but disconnecting the "keep alive" voltage to the memories when the auxiliary CD input is used IS ONE CRAPPY DESIGN!

As I said before, the warranty period is long past. However, if you'd like me to continue buying more than parts at Radio Shack, I'd appreciate your authorizing an after-the-warranty return of my radio for a better model.
---------- cut here ---------- cut here ---------- cut here ----------

Incidentally, I used the "CD input" to feed audio from my HF transceiver to the pickup-truck speakers, which worked very well! But I never imagined I'd have to UNplug that input every time before turning the ignition off just so the AM/FM radio could remember its programming!

WHAT HAPPENED

About a month later, in response to the above letter, I received a call from Radio Shack headquarters asking me to identify the Radio Shack store from which I purchased the crappily-designed AM/FM radio. When I identified our local store, I heard someone in the background say

"That's one of our franchise stores."

The caller thanked me, AND THAT'S THE LAST I'VE HEARD OF THE MATTER!

MY CONCLUSIONS
----
1. Don't be slow in using new purchases, or (stated another way) don't buy anything until I am actually ready to use/install it.

2. Try EVERY possible feature ASAP.

3. Do NOT buy from a Radio Shack franchise (locally-owned) store, 'cause Radio Shack Headquarters apparently can't even ask it to correct a problem.

4. Do NOT buy anything "big" (i.e., more than miscellaneous parts) from Radio Shack, period!

Of course, your mileage may vary.

10.240MHz crystals are common in other areas because they can be divided down easily with binary counters (similar to the 8.192MHz TCXO's mentioned here recently). You may be able to find them among standard crystals in electronic supplier's catalogs.

In a lot of commercial equipment, the same frequency is used to convert from 10.7MHz to 455kHz. They just use a relatively wider filter in the first IF, and so the 5KHz difference isn't a problem, and then the 455KHz filter is the main selectivity.

This is the scheme I've seen used in dual conversion CB sets, with synthesizers at least. Some cordless phones (not all are dual-conversion). 49MHz superhet walkie talkies may use the frequency; i can't find the manual for the set I bought which has a schematic; if they don't use 10.240 then they are bound to use the exact frequency. Perhaps baby monitors use the scheme; I've not looked inside one so it's just an assumption that some might.

The scheme using a wider filter at the first IF depends on what you are doing. I have some old 10.7MHz FM filters that must date to the days of 30KHz bandwidth, and I doubt the 5KHz offset would be a problem. A lot of the equipment that uses the scheme uses a ceramic filter in the first IF, and it's more like that in an FM broadcast receiver, though I've not checked bandwidth to see if they are narrower. Scanners apparently use this scheme, and I have a Radio Shack single frequency monitor receiver that does too

The problem with 10.245MHz crystals is that the ones I've found have been in equipment that has a 10.7MHz filter and a 455KHz filter, so it's hardly a solution to the filters that need that second conversion.

Not intending to start a flame war on a subject has has been
beaten to death over and over ...

A person would not post to multiple groups because it would
be a basic net etiquette violation. The internet was developed
to provide a forum for the exchange of constructive ideas, not as
a low cost vehicle for advertising. Every time you spam multiple
newsgroups you create excessive bandwidth consumption, and break the
focus of groups that have no interest in what you are attempting
to sell.

This is why separate subject specific newsgroups have been created ...
if someone wants to buy something then they go there ... potential
sellers should do the same to get the best exposure.

If you are unsure of proper net etiquette protocol, you can easily find
answers in the news.answers group.

Good Luck

1674. RX-320 Free Beta Software

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-09 00:00:00 UTC
From: mktg@ix.netcom.com
Message-ID: <36c6b1fb.10596913@nntp.ix.netcom.com>
Source record: 73697

February 9, 1999

Dear RX-320 User,

Last fall I acquired one of the new Ten-Tec RX-320 receivers. It is really a delight to use and listen to.

After a few weeks, it occurred to me that the supplied software did not fully use all the functionality of the radio. I wondered what else could be done.

So, I wrote my own software. It is not as pretty as Ten-Tec's but it does have some additional features:

- Squelch (adjustable)
- Scanning of lists (files) with adjustable delay
- Tuning in a variety of steps from 1 Hz to 1 Mhz
- 34 selectivity settings
- Runs under DOS or Windows - even works on a 80386 computer using DOS

The program has only been run by me (on several computers), so that really makes it a Beta version.

I would be happy to supply free of charge this Beta version to anyone interested who has an RX-320. The software will not function without an RX-320.

The program is supplied along with several other files in a single zip file. Installation and removal are simple, as the program does not affect any system settings either in DOS or windows.

The program is easy to use - just press various keys to engage the different functions.
